Sampling

Sampling Procedure

L'échantillon de l'EA&P Mali ciblait tous les enfants âgés de 6-59 mois vivant dans 1500 ménages. Le RGPH de 2009 a servi de base de sondage pour sélectionner initialement 100 grappes, en raison de 15 ménages par grappe. Pour compenser les non-réponses, la taille de l'échantillon a été augmentée de 10 %, ce qui a finalement fourni une taille d'échantillon de 110 grappes. Deux domaines d'études ont été identifiés : urbain et rural. L'échantillon est stratifié, pondéré et représentatif au niveau national et au niveau urbain et rural.

- Au premier degré, 110 grappes, constituant les Units Primaires de Sondage (UPS), ont été tirées de façon systématique l'intérieur de chacune des 2 strates, urbain et rural, avec une probabilité proportionnelle à la taille de la SE, savoir le nombre de ménages dans la SE.
- Au deuxième degré, un échantillon de 15 ménages a été sélectionné dans chaque grappe à partir de la liste de ménages établie lors de l'opération de dénombrement de chacune des 110 grappes sélectionnées.
- Les 110 grappes sélectionnées dans l'échantillon ont pu être enquêtées à l'exception d'une grappe dans la région de Kidal.

Response Rate

Au total, 1631 ménages ont été sélectionnés et, parmi eux, 1621 ménages ont été identifiés et étaient occupés au moment de l'enquête. Parmi ces 1621 ménages, 1617 ont pu être enquêtés avec succès, soit un taux de réponse de 99,8 %.

Questionnaires

Overview

Ce questionnaire a été développé à partir des questionnaires de base du programme Demographic and Health Surveys (DHS) et du programme Malaria Indicator Surveys (MIS) (ORC Macro, 2005 ; Roll Back Malaria, 2005 ; WHO, 2005), préalablement adaptés au contexte du Mali et en tenant compte des objectifs de l'enquête. Par ailleurs, pendant la formation, le questionnaire a été traduit en Bamana, Sonra et Peulh de manière qu'au cours de l'enquête, les questions soient posées le plus fidèlement possible par les enquêtrices/enquêteurs.

DATA COLLECTION NOTES

La collecte des données de l'EA&P Mali a été réalisée par six équipes. Les travaux de terrain se sont déroulés en trois étapes principales. Le pré-test a constitué la première étape (17-18 août 2010). Le dénombrement des ménages des zones échantillonnées s'est déroulé en même temps que la collecte de l'enquête principale par les équipes d'enquêtes (25 août au 27 octobre 2010). Ainsi, les opérations de cartographie et de dénombrement des zones sélectionnées étaient assurées par les six équipes de collecte de l'enquête principale.

Data Collectors

Information Statistique	INFO-STAT	

Data Processing

Data Editing

La saisie des données sur micro-ordinateur a débuté deux semaines après le démarrage de l'enquête sur le terrain, en utilisant le logiciel CSPro, développé par le programme par le projet MEASURE DHS de l'USAID et le Bureau du Recensement des États-Unis. Deux agents de bureau étaient chargés de la vérification des questionnaires avant de les transmettre à la saisie. Cette saisie a été réalisée par cinq opérateurs de saisie, de septembre à novembre 2010, sous la supervision du gestionnaire de base des données d'INFO-STAT. Tous les questionnaires ont fait l'objet d'une double saisie pour éliminer du fichier le maximum d'erreurs de saisie. Par ailleurs, un programme de contrôle de qualité a permis de détecter, pour chaque équipe et même, le cas échéant, pour chaque enquêtrice/enquêteur, certaines des principales erreurs de collecte. Ces informations ont été immédiatement communiquées aux équipes de terrain lors des missions de supervision, cela afin d'améliorer la qualité des données.

Après la saisie, les données ont été relues en vue de vérifier la cohérence interne des réponses. Ce travail a été effectué par une équipe composée de deux agents de révision, qui ont été sélectionnés pour cette tâche sur la base de leurs résultats obtenus au cours de leur travail lors des enquêtes précédentes. La vérification finale a été réalisée par le responsable d'INFO-STAT avec l'assistance de l'informaticien d'ICF Macro, utilisant une technique prouvée au cours de dizaines d'enquêtes similaires.

Data Appraisal

Estimates of Sampling Error

Les estimations obtenues partir d'une enquete par sondage sont sujettes deux types d'erreurs: les erreurs de mesure et les erreurs de sondage. Les erreurs de mesure sont celles associes la mise en oeuvre de la collecte et de l'exploitation des donnees telles que l'omission de mnages slectionnns, la mauvaise interprétation des questions de la part de l'enquêtrice ou de l'enquête, ou les erreurs de saisie des donnees. Bien que tout le possible ait t fait pour minimiser ce type d'erreur pendant la mise en oeuvre de l'EA&P Mali 2010, il est difficile d'viter et d'valuer toutes les erreurs de mesure.

Par contre, les erreurs de sondage peuvent tre values statistiquement. L'chantillon slectionn pour l'EA&P Mali 2010 n'est qu'un parmi un grand nombre d'chantillons de mme taille qui peuvent tre slectionnns dans la mme population avec le mme plan de sondage. Chacun de ces chantillons peut produire des rsultats peu differents de ceux obtenus avec l'chantillon actuellement choisi. L'erreur de sondage est une mesure de cette variabilit entre tous les chantillons possibles. Bien que cette variabilit ne peut pas tre mesure exactement, elle peut tre estime partir des donnees collectes.

L'erreur-type (ET) est un indice particulièrement utile pour mesurer l'erreur de sondage d'un paramtre (moyenne, proportion ou taux), elle est la racine carree de la variance du paramtre. L'erreurtype peut tre utilise pour calculer des intervalles de confiance dans les quels nous considrons se trouver la vraie valeur du paramtre avec un certain niveau de confiance. Par exemple, la vraie valeur d'un paramtre se trouve dans les limites de sa valeur estime plus ou moins deux fois de son erreur-type, avec un niveau de confiance de 95 %.

Si l'chantillon avait t tir d'aprs un plan de sondage alatoire simple, il aurait t possible d'utiliser des formules simples pour calculer les erreurs de sondage. Cependant, l'chantillon de l'EA&P Mali 2010 tant un chantillon stratifi et tir deux degrs, des formules plus complexes ont t utilisees. Un programme de Macro en logiciel SAS a t utilis pour calculer les erreurs de sondage suivant la mthodologie statistique approprie. Ce module utilise la mthode de linarisation (Taylor) pour des estimations telles que les moyennes ou proportions.

Remarque: pour plus d'informations sur le calcul d'erreurs de sondage, voir l'annexe B dans le rapport intitul Enquete sur la Prvalence de l'Anmie et de la Parasitmie Palustre chez les Enfants 2010, Rapport Final.
