Sampling

Sampling Procedure

A stratified two-stage sampling design was employed. In the first stage schools in the defined target population were sampled on a probability-proportional-to-size (PPS) basis from sampling frames that individual countries submitted to the SACMEQ Coordinating Centre. The PPS sampling technique meant that relatively large schools had a higher probability of being selected than smaller schools. In the second stage of sampling learners were sampled from all the Grade 6 classes in each of the sampled schools using computer-generated random numbers. Twenty five (25) learners (minimum cluster size) were sampled where the total number of all enrolled Grade 6 learners at the time of data collection was greater than 25. Where the number of Grade 6 learners was 25 or less than 25 in a school, all the Grade 6 learners were included in the sample.

For a detailed account of how the sampling of schools and learners was carried out, including the software that was used, in the SACMEQ III project the reader may refer to Ross and Saito (in press).
