

South Africa - IDASA Local Election Study 1995

IDASA

Report generated on: May 1, 2014

Visit our data catalog at: <http://microdata.worldbank.org>

Sampling

Sampling Procedure

The sample was drawn using a multi-stage, clustered random probability sample disproportionately stratified by province, population group and community size (metro, city, large town, small town, village and rural).

Weighting

Due to disproportionate sample, it was necessary to weight the data up to the universe, i.e. the South African voting public. The sample was weighted according to province, age, gender, type of area, language, income and education and projected onto the universe. The results were then weighted to reflect an electorate estimated at 24.3 million voters. A weight variable has been included in the dataset.

Questionnaires

No content available

Data Collection

Data Collection Dates

Start	End	Cycle
