Sampling

Sampling Procedure

For the Domestic Tourism Survey 2009 Statistics South Africa used a sample design developed by their Methodology and Evaluation division. This sample frame can be used as a general-purpose household survey frame for all household surveys, irrespective of the sample size requirement of the survey. Stats SA's household-based surveys use a master sample of 3 080 primary sampling units (PSUs) made up from the 80 787 enumeration areas (EAs) created for the 2001 Population Census.

For the Domestic Tourism Survey 2009, two samples were drawn in order to obtain two reference periods. The first sample was for the reference period December 2008 to February 2009, and consisted of 1 533 primary sampling units and 15 725 dwelling units. The second sample was never used, due to operational constraints. The DTS 2009 sample was designed to be representative at provincial level and within provinces at metro/non-metro level. Within the metros, the sample is further distributed according to geographical type. The four geography types are: urban formal, urban informal, farms, and tribal areas. The sample for the DTS 2009 was based on a stratified two-stage design, with probability proportional to size (PPS) sampling of PSUs in the first stage, and sampling of dwelling units (DUs) with systematic sampling in the second stage.

Response Rate

The eligible households in the sampled dwellings can be divided into two response categories: respondents and non-respondents.

a) Respondents: This category consists of eligible households in the sampled dwellings that completed the survey questionnaire and provided usable survey responses.
b) Non-respondents: These are the eligible households in the sampled dwellings that did not complete the questionnaire, e.g. refusal, no contact, temporarily absent.

In general, the non-response adjustment was applied at PSU level and only in those cases where the nonresponse at the PSU level was too large, the non-response adjustment was applied at the stratum level.

Weighting

Sampling weights for the data collected from the sampled households are constructed so that responses can be expanded appropriately to represent the entire population of South Africa. The weights are the result of calculations involving several factors, including design weights, adjustment for non-response, and benchmarking to known population estimates from the Demographic Analysis division of Stats SA. The final survey weights are constructed by calibrating the adjusted base weight to the known population counts at national and provincial levels (which are supplied by the Demographic Analysis division of Statistics SA), cross-classified by 5-year age groups (0-4, 5-9, 10-14, 55-59, 60-64, and 65 and over), gender and race. The provincial population estimates are cross-classifiedby broad age groups (0–14, 15–34, 35–64, and 65 years and over). The calibrated weights are constructed to ensure that all persons in a household have the same final weight (integrated weighting).

DATA COLLECTION NOTES

For the Domestic Tourism Survey 2009 survey officers employed and trained by Statistics SA visited the sampled dwelling units in each of the nine provinces. During the first phase of the survey, sampled dwelling units were visited and informed about the coming survey as part of the publicity campaign, which took place from 5-10 May 2009. Four hundred and thirty seven enumerators, 127 supervisors and 59 district coordinators participated in the survey. An additional 37 quality assurors were responsible for monitoring and ensuring questionnaire quality. National training took place over a period of three days and district training was done one week later for eight days in all nine provinces.
