Sampling

Sampling Procedure

A amostra da pesquisa, uma subamostra da Pesquisa Nacional por Amostra de Domiclios (PNAD) do IBGE, foi desenhada para se obter resultados representativos para o total da regio, para as reas urbanas e rurais e para cada estado independente. Trata-se de uma amostra probabilfstica, selecionada aleatoriamente em dois estgios: no primeiro estgio, selecionaram-se os setores censitrios, e, no segundo, os domicflios dentro de cada setor.

DESENHO DA AMOSTRA

A Pesquisa sobre Sade Familiar no Nordeste - PSFNe 1991 foi implementada na Regio Nordeste do pais. Esta Regio constitutda por nove estados: Maranho, Piaul, Cear, Rio Grande do Norte, Parafba, Pemambuco, Alagoas, Sergipe e Bahia. A amostra foi desenhada para se obter aproximadamente 5500 entrevistas completas de mulheres em idade frtil (15-49 anos de idade) a serem coletadas em 7695 domiclios selecionados, assumindo uma taxa geral de resposta de 75%. Esta amostra, probabillstica, representativa para cada domlnio (rea geogrfica) de estudo, estratificada dentro da regio: urbano/rural e estados; e selecionada em dois estgios: primeiro selecionaram-se os setores censitrios e, a seguir, os domicflos. Este desenho permite obter estimativas representivas a nvel urbano/rural, a nvel de cada estado, a nvel urbano/rural na Bahia, e a nvel urbano, no Cear e em Pernambuco.

Como base para as unidades primrias da amostra (UPA), usou-se a amostra da PNAD (Pesquisa Nacional por Amostra de Domicflios) desenvolvida pelo 1BGE (Fundao Instituto Brasileiro de Geogrfica e Estatstica) que, por ser uma amostra maior, foi considerada como marco de seleo da amostra de setores censitrios para a PSFNe 1991.

A seleo dos setores censitarios foi feita de forma sistemtica e proporcional ao nmero de domicflios censitrios da amostra da PNAD, e de forma sistemtica para a PSFNe 1991. No total, foram selecionados 361 setores censitrios: 224 urbanos e 137 rurais, com uma mdia de 21 domicilios por setor. A seleo de 21 domicflios em cada setor urbano foi sistemtica e em cada setor rural foi de um grupo de 21 domicflios consecutivos.

A frao total da amostra para cada setor foi calculada de seguinte forma:
fl = Pti * P2 onde
f~ = frao da amostra total em cada setor
PI~ = probabilidade de seleo do i-simo setor no domIrtio
P2~ = probabilidade interna de seleo de domicflios no i-simo setor

Esta frao total da amostra foi calculada para cada setor, e o valor inverso constitui-se no fator de ajuste para cada setor, com base no desenho. A ponderao final para cada setor foi calculada usando este fator de ajuste e o correspondente ao da no resposta individual e de domicilio (a nvel de estado).

Response Rate

Em cada domicilio selecionado, foram entrevistadas todas as mulheres de 15 a 49 anos. Para a entrevista com maridos, utilizou-se uma subamostra de domicflios, correspondente metade do total da amostra. Nesses domicilios, foram entrevistados todos os maridos de mulheres entrevistadas.

O nmero de domicflios selecionados foi de 7695, com 6064 entrevistas completas, sendo identificadas 6843 mulheres e entrevistadas 6222. Para os maridos, foram identificados 1689 e entrevistados 1178.

Obtiveram-se informaes completas para 81,9% dos 4820 domiclios na rea urbana e para 73,6%, na rea rural (de um total de 2875). A maioria dos casos de entrevistas no realizadas deve-se ao fato do domicilio estar desocupado: 8,4%, na rea urbana e 15,7%, na rea rural; este mesmo fato foi observado em todos os estados. Pode-se observar tambm que no houve diferenas substanciais entre os diversos estados e reas, quanto ausncia de adultos ou recusas.

Nos domicilios em que se coletaram informaes, foram identificadas 6843 mulheres elegveis para a entrevista1, 89,9% foram entrevistadas com axito na rea urbana, assim como 93,3%, na rea rural. A maioria dos casos em que nao houve entrevista corresponde tt ausencia das mulheres: 7,2% na rea urbana e 4,6% na rea rural. Observa-se um comportamento semelhante entre os diversos estados. Os demais casos correspondem a entrevistas marcadas que ntio chegaram a se realizar e a entrevistas incompletas.

Questionnaires

Overview

Para o levantamento dos dados, adotou-se metodologia de entrevistas domiciliares, com apficao de quatro tipos de questionrios: uma ficha de domicilio, um questionrio para mulheres, um para maridos e um, mais breve, sobre as comunidades. Estes questionrios tiveram como base o Modelo A, usado pelas Pesquisas Demogrficas e de Sade (DHS), e que comparvel com o da Pesquisa Nacional sobre Sade Matemo-Infantil - PNSMIPF 1986.

a) A ficha de domicilio levantou informaes sobre todos os moradores habituais e visitantes que dormiram no domicilio na noite anterior e entrevista. Essas informaes referem-se idade, sexo, instruo, filiao e relao com o chefe do domicilio. Alm dos dados dos moradores, foram'coletadas informaes sobre as caractersticas e as condies scio-sanitrias do domicilio.

b) O questionrio de mulheres, alm de investigar suas caractersticas scio-econ6micas, abrangeu questes sobre reproduo, anticoncepo, gravidez e amamentao, vacinao, prevalncia e tratamento de doenas crticas infantis, planejamento da fecundidade e conhecimento sobre doenas sexualmente transmissfveis/AIDS. No final, este questionrio contm um calendrio, onde foram registradas, mas a mas, para os ltimos 5 anos, informaoes sobre os seguintes eventos da vida da entrevistada: gravidez, nascimentos, abortos, uso e interrupo de uso de mtodos anticoncepcionais, amenorr6ia e abstinencia pos-parto, amamentao, unies, mudanas e locais de residncia, e ocupao. Este calendrio possibilitou um maior detalhamento e checagem das informaes obtidas pelo questionrio.

c) O questionrio dos maridos permite uma comparaao com as informaes levmltadas para as mulheres sobre reproduo, anticoncepo, planejamento da fecundidade e conhecimento de doenas sexualmente transmissfveis/AIDS.

Alm das entrevistas domiciliares, foram levantados dados sobre as comunidades referentes aos setores censitrios selecionados. O questionrio para a comunidade contm informaes suscintas sobre servios de sade, transporte, educao e atividades econmicas.

DATA COLLECTION NOTES

TRABALHO DE CAMPO

Para facilitar a operacionalizao do trabalho de campo, a regio foi dividida em duas reas de coordenao, sediadas em Salvador e Fortaleza, capitais dos Estados da Bahia e Cear, respectivamente. Em cada local, foi realizado um treinamento de duas semanas, ministrado pela mesma equipe, formada por membros, da BEMFAM e do Macro Intemational Inc., para garantir a uniformidade das informaes. O treinamento constou de uma parte terica (aulas sobre os temas abordados pela pesquisa, compreenso e manejo do questionrio), e de uma parte prtica, com aplicao de questionrios. A partir desses treinamentos, foram selecionadas oito equipes, quatro para cada rea. Cada equipe compunha-se de uma supervisora, trs entrevistadoras e um entrevistador, responsvel pela entrevista com os maridos. O trabalho de campo teve incio logo aps os treinamentos, desenvolvendo-se durante o perodo de agosto a dezembro de 1991. Cada equipe ficou encarregada de um determinado nmero de setores e recebeu um roteiro de deslocamentos, previamente planejado pela coordenao.

Para garantir a qualidade dos dados, as supervisoras revisaram os questionrios em campo e checaram periodicamente algumas entrevistas. Os questionrios foram novamente revisados pelas coordenadoras de cada rea, que, alm dessa tarefa, visitaram cada equipe para dar reciclagens e minimizar erros. As equipes foram visitadas, tambm, pelo "staf?' central da pesquisa, que fez superviso durante todo o pertodo do campo.

Data Processing

Data Editing

O processamento dos dados foi realizado simultaneamente ao trabalho de campo. Para a entrada dos dados, edio e tabulao foi utilizado o software ISSA (Integrated System for Survey Analysis).

Data Appraisal

Estimates of Sampling Error

O principal objetivo da PSFNe 1991 fomecer estimativas para um nmero de variveis demo- grficas, de planejamento familiar e de sade, atravs de entrevistas domiciliares, usando-se uma amostra cientificamente selecionada de uma populao definida: a populao de mulheres em idade reprodutiva (15-49 anos). As estimativas para estas variveis, entretanto, esto sujeitas a dois tipos de erros: erros relacionados amostra e erros no-relacionados amostra. O erro total o erro resultante destes dois tipos de erros mencionados acima, e a diferena entre a estimativa da varivel e o valor real.

Os erros que no so provenientes da amostragem so aqueles que persistiriam mesmo se toda a populao fosse coberta. Estes erros so devidos a erros nas atividades do trabalho de campo durante a pesquisa. Como exemplo, podemos citar a no-localizao e visita ao domicilio selecionado, problema no preenchimento do questionrio pela entrevistadora, erros de codificao e digitao etc. Infelizmente, no possvel medir a extenso destes erros que no esto relacionados amostragem e que, certamente, afetaro os resultados da pesquisa.

Os erros de amostragem so aqueles que resultam da seleo da amostra da populao em estudo atravs de um desenho de amostra especffico. Estes erros fomecem uma estimativa de como se obter resultados do comportamento de uma varivel especffica repetindo a pesquisa por amostragem com o mesmo desenho. Como o erro de amostragem uma funo do desenho da amostra, ao contrrio dos erros no-relacionados amostra, ele pode ser medido.

Os erros de amostragem foram computados para a PSFNe 1991 usando o "software" CLUSTERS, elaborado para ser usado na World Fertility Survey (WFS). Este programa leva em considerao a estrutura vigente da amostra e, em particular, seu desenho, que estratificado em estgios mltiplos e em conglomerados. Os resultados gerados pelo "software" CLUSTERS fornecem somente uma estimativa total tios erros de amostragem. O programa no identifica em qual dos estgios do desenho da amostra ocorreu O erro, O programa CLUSTERS trata qualquer porcentagem ou mdia como uma razo estatstica $r = y/x$ onde, y representa o valor total da amostra para a varivel y, e x representa o nmero total de casos no grupo ou subgrupo em considerao. O clculo da variancia r computado utilizando-se a frmula a seguir, sendo
o erro padro a raiz quadrada da variancia:
var(r) : l_f H [__mh (mh-,.V, zhi2 z2~1 x z h---I mh-I i:l ~-hlJ
onde:
zra = y~ - r.xra, e
zh = Yh - r.Xh

h representa o estrato e varia de 1 a h,
m h o nmero total de setores censitrios selecionados no estrato h ~,
Y~a a soma dos valores da varivel y no setor censitrio i do estrato h t~
xra a soma do nmero de casos (mulheres no setor censitrio i do estrato hth), e
f a frao total da amostra cujo valor to pequeno que 6 ignorado pelo programa CLUSTERS.

Alm do erro padro, o programa CLUSTERS calcula o efeito do desenho para cada estimativa, DEF~, que se define como a razto entre o erro padro usando um determinado desenho de amostra e o erro padro que resultaria se o desenho da amostragem implementado fosse a amostragem aleatria simples. Um valor de DEFI igual a 1.0 indica que o desenho utilizado to eficiente quanto uma amostragem aleatria simples, enquanto que um valor superior a 1.0 indica um aumento no erro de amostragem em decorrncia do uso de um desenho mais complexo e estatisticamente menos eficiente. O programa CLUSTERS computa tambm o erro relativo e os limites de confiana para as estimativas.

Os erros de amostragem para a PSFNe foram calculados para algumas variveis selecionadas, consideradas de maior interesse. Os resultados so apresentados neste anexo para o total da Regio Nordeste, para as reas urbanas e rurais, para cada estado da regio, para cada nvel especfico de instruo e para cada grupo quinqenal de idade.

A Tabela B. 1 do Relatorio Final, apresenta para cada varivel selecionada o tipo de estatstica calculada (proporo ou mdia) e a populao base.

Nas tabelas B.2 a B.25 s~o apresentadas para cada varivel selecionada a media ou valor proporcional da estimativa (R), o erro padro (SE), o nmero de casos no-ponderados (N) e ponderados (WN) no qual a estimativa baseada, o valor do efeito estimado do desenho (DEFF), o erro padro relativo (SE/R) e o intervalo de 95% de confiana (R + 2SE).

Em geral, os erros padrOes relativos da maioria das estimativas para a regio como um todo so pequenos, exceto para estimativas com propores pequenas.

Para estimativas de subpopulaes como reas geogrficas existem alguns diferenciais em relao ao erro padro relativo.

Para a varivel EVBORN (filhos nascidos vivos de mulheres de 15-49 anos de idade), por exemplo, o erro padro relativo como uma porcentagem de mdia estimada para a regio como um todo, para as reas urbanas e para o Estado do Cear de 2,4%, 2,4% e 4,5%, respectivamente. O intervalo de confiana (calculado para a varivel EVBORN) pode ser interpretado do seguinte modo: a media para a amostra total 2,637 e o erro padro de 0,063. Assim, para se obter um intervalo de 95 % de confiana deve-se subtrair duas vezes o valor do erro padro para a amostra estimada, por exemplo 2,637 + 0,126. Existe uma grande probabilidade (95 %) de que o valor real do nmero mdio de filhos nascidos vivos de mulheres de 15-49 anos estar entre 2,511 e 2,764.

Ficha da Domicilo

Title	Ficha da Domicilo
Author(s)	Sociedade Civil Bem-Estar Familiar no Brasil -BEMFAM
Date	1991-08-01
Country	Brazil
Language	Portuguese
Contributor(s)	Macro International Inc.
Description	A ficha de domicilio levantou informações sobre todos os moradores habituais e visitantes que dormiram no domicilio na noite anterior e entrevista. Essas informações referem-se à idade, sexo, instrução, filiação e relação com o chefe do domicilio. Além dos dados dos moradores, foram'coletadas informações sobre as características e as condições sócio-sanitárias do domicilio.
