Sampling

Sampling Procedure

DISEÑO DE LA MUESTRA.

Para propósitos de la encuesta se definió como población de estudio a todas las mujeres entre 15 y 49 años de edad residentes en viviendas particulares a la fecha de la entrevista dentro del territorio nacional con la excepción de las regiones Oriental e Insular, regiones que representan menos del tres por ciento del total nacional en términos de población.

Considerando las experiencias en el pasado de estudios similares y teniendo la necesidad de análisis más detallados para un número de zonas del país y grupos específicos, se fijó un tamaño de muestra esperado de 6,000 mujeres entre 15 y 49 años. El marco muestral utilizado para la ENDESA-87 se basa en la cartografía y los resultados del último censo de población de 1982. En este marco el país está dividido en áreas geográficas de tamaño muy conveniente para el levantamiento del censo, denominadas sectores censales.

El diseño de muestra para la ENDESA-87 en Ecuador consiste de dos etapas claramente definidas. La primera etapa considera la selección del número de sectores censales asignados a cada región (Sierra o Costa) en forma sistemática y con probabilidad proporcional al tamaño (tamaño de cada sector en términos de su población censal). Para ello se tuvo en cuenta el grado de conglomeración de los sectores censales, una estratificación cruzada de región (Sierra y Costa) por zona de residencia (urbano y rural), y un ordenamiento geográfico en espiral de las divisiones administrativas denominadas cantones en cada grupo cruzado. En total fueron seleccionados 120 sectores censales urbanos y 76 rurales. La probabilidad de selección del sector censal es expresada en la siguiente fórmula,

$$P(i) = m [N(i) / N]$$

donde m es el número de sectores censales seleccionados en determinada región, N(i) es la población censal del sector censal i-simo seleccionado, y N es la población total censal de la región bajo consideración.

Una vez seleccionados los sectores censales y con base en el número esperado de mujeres elegibles por sector censal, se estableció el tamaño del conglomerado último, 25 en la zona urbana y 39 en la zona rural. Estos números son equivalentes a una población total de 105 y 160 respectivamente.

Inmediatamente después, a cada sector censal seleccionado le fue asignado una medida de tamaño calculada como su población censal dividida por el tamaño poblacional del conglomerado último. En otros términos el valor asignado s(i) es la división de N(i) por 105 en lo urbano (o por 160 en lo rural) y redondeado al entero más cercano.

Cuando la medida asignada a un determinado sector censal fue de 5 o menos unidades, en dicho sector censal se actualizó la información censal con un listado completo de viviendas en 1987. Si la medida asignada al sector fue mayor de 5, el sector censal fue dividido en dos partes casi iguales con base en la información censal y solo una de las dos fue seleccionada para la completa actualización del listado de viviendas. Después de la actualización de viviendas en los sectores seleccionados, el área actualizada fue dividida en un número de segmentos (conglomerados últimos) de igual tamaño. El número de segmentos fue igual al número de medidas asignadas al sector censal si dicha medida fue de 5 o menos, o igual al número de medidas asignadas a la mitad del sector seleccionado si la medida del sector total fue mayor de cinco.

Finalmente, después de la división en segmentos del área actualizada de los sectores seleccionados, se procedió a la selección de un segmento en cada sector. Todas las viviendas y mujeres entre 15-49 años en los segmentos seleccionados serán visitadas para entrevistas durante el trabajo de campo.

En resumen, se tiene que las probabilidades de selección de las diferentes etapas para sectores con s(i) igual o menor a 5:

$$P(i) = m [N(i) / N] \quad P(2) = 1 / s(i) \quad f = P(i) * P(2) = 1/315,$$

y para sectores con s(i) mayor a 5 se mantiene,

$$P(i) = m [N(i) / N] \quad P(2) = 2N(ij) / N(i) \quad P(3) = 1 / s(ij) \quad f = P(i) * P(2) * P(3) = 1/315$$

donde j = i, 2 indica, para cada sector censal, cada una de las partes en que fue dividido, s(ij) = N(ij) / 105 en cada sector censal urbano y s(ij) = N(ij) / 160 en cada sector censal rural.

Response Rate

Para el total de la muestra, el 95.7 por ciento de las direcciones visitadas fueron declaradas viviendas particulares. Del total de viviendas, 90.1 por ciento estaban habitadas al momento de la entrevista y 5.6 por ciento estaban desocupadas. De las viviendas habitadas el 95.9 por ciento pudo ser efectivamente entrevistadas, lo que representa una tasa de respuesta bastante adecuada a nivel nacional. En las viviendas entrevistadas se encontraron 4967 mujeres elegibles para la entrevista individual, 10 que revela un promedio nacional de 1.08 mujeres elegibles por vivienda. Un 94.9 por ciento de las 4967 mujeres elegibles fue exitosamente entrevistadas, proporcin tambien satisfactoria. La principal razn de no entrevista es la ausencia de la mujer elegible. El rechazo constituye solo un 1.7 por ciento.

Los porcentajes de entrevistas de hogar y entrevistas individuales completas por regin : En general, no hay grandes diferencias en los resultados entre las regiones. En Quito y Guayaquil, sin embargo, la proporcin de entrevistas individuales completas es ligeramente menor que en las dems regiones.

DATA COLLECTION NOTES

ORGANIZACION DE LA ENDESA-87

Para la realizacin de ENDESA-87, el CEPAR firm un convenio de colaboracin tcnica con el Instituto Nacional de Investigaciones Nutricionales y Mdico Sociales del Ministerio de Salud Pblica (ININMS), colaboracin que se concretO especificamente con el trabajo del Investigador Mdico, Jefe del Proyecto, con la revisin general de las labores de la Encuesta y con el anlisis de algunos temas del Informe Final.

La implementacin del proyecto cont con un Comit Tcnico Ejecutivo, formado por funcionarios de CEPAR, ININMS e IRD, para la supervisin y coordinacin general. El Jefe del Area de Investigacin del CEPAR fu el Director de la Investigacin y el Investigador Mdico del ININMS actu como Jefe del Proyecto. Investigadores del CEPAR, ms otros tcnicos expresamente contratados para estas labores, fueron responsables de la muestra, la capacitacin del personal de campo, las operaciones de campo, el procesamiento y anlisis de los datos.

CALENDARIO DE ACTIVIDADES

La planificacin y organizacin del trabajo se realiz en el mes de diciembre de 1986. El entrenamiento del personal de campo se imparti en las tres primeras semanas de enero de 1987 y termin con la seleccin de 10 supervisoras, 40 entrevistadoras y 2 coordinadores para Costa y Sierra, todos ellos con instruccin superior en Medicina o Servicio Social. Paralelamente, se llev a cabo la actualizacin de la muestra y la preparaciOn de la cartografa, as como la revisin y edicin de manuales, cuestionarios y formularios de control.

El trabajo de campo para la recoleccin de la informacin se inicio a continuacin de las labores arriba descritas, y concluyo a fines de marzo. Durante febrero se preparo el equipo de procesamiento de datos, consistente en 1 supervisor y 6 digitadores que se dividieron el trabajo en doble jornada diaria. La Encuesta de la Comunidad se realizo entre marzo y abril con el personal ms calificado de los actualizadores de la muestra.

Los primeros tabulados y la primera versin del llamado Informe Preliminar fueron terminados a fines de abril y la edicin de dicho informe se cumplio en julio de 1987. La preparacin de los listados iniciales de control, frecuencias y tabulados se extendi hasta junio y en julio se inici la elaboracin de los tabulados definitivos y el anlisis que se da a conocer en la presente publicacion.

Data Appraisal

Estimates of Sampling Error

En el cuadro II.1 se presenta una lista de las 27 variables consideradas de mayor inters en la encuesta. Para cada una se especifica el tipo de indicador y el grupo de mujeres para las cuales est definida la variable. En el Cuadro II.2 se incluye, para cada variable, el correspondiente valor de r (sea un promedio o un porcentaje), el error estndar y el nmero de casos en la muestra total. Adems del error estndar, en los cuadros aparecen tambin DEPT, la correlacin intraclass (ROH) y el intervalo con 95 por ciento de confianza. La poblacin base calculada por el programa CI/JSTERS para las ltimas dos variables no es la verdadera poblacin base. El clculo del error de muestreo para los diferentes grupos en esas variables (BTET y MDATT) fue hecho indirectamente a travs del asignamiento a cada mujer del nmero de nios con la caracterstica bajo estudio.

El examen del cuadro revela que, en general, los errores estndar son pequeos y que por ello la muestra puede calificarse como bastante precisa; esto es especialmente claro en la antepenltima columna donde aparecen los errores estndar relativos. Para ilustrar el uso de las cifras en este cuadro considrese la variable IDEAL (tamao deseado de la familia) que estndar: $3.047 \pm (.042)$, lo que produce el intervalo de 2.963 a 3.131, dentro del cual se tiene una confianza de 95 por ciento de que se encuentra el valor de la poblacin.
