Sampling

Sampling Procedure

EL MAREO MUESTRAL

Uno de los objetivos primordiales de la ENDES 1991-1992 es brindar estimaciones de los principales indicadores demográficos a nivel de las trece regiones administrativas recientemente delineadas. El marco muestral de viviendas del INEI, creado en 1984 para la Encuesta Nacional de Nutrición y Salud y actualizado para encuestas posteriores, no servía para este tipo de desagregación, por lo cual fue necesario diseñar un marco muestral nuevo.

El marco muestral fue desarrollado por el INEI y es el que servir de base para los Censos Nacionales de Población y Vivienda previstos para 1993. Para ello fue necesario actualizar la cartografía del país para identificar las nuevas manzanas y los asentamientos poblacionales para luego proceder al registro de edificios y viviendas. En el proceso de actualización, el cual tuvo lugar entre Febrero y Diciembre de 1991 y en el cual participaron alrededor de un centenar de personas, se dio prioridad a los distritos seleccionados para la encuesta.

En el Cuadro A.1 se presentan estimaciones de la población de mujeres en edad fértil por región y por áreas metropolitanas y no metropolitanas, derivadas de las últimas proyecciones de población preparadas por el INEI en 1990. Por área metropolitana (METRO) se entiende la población residente en los distritos que conforman una ciudad y que suman a más de 100,000 (con la excepción de la región San Martín, cuyas ciudades de Tarapoto y Moyobamba han sido consideradas área metropolitana sin satisfacer el criterio de 100,000). El complemento de METRO es denominado RESTO.

Según las proyecciones, el número de ciudades con población mayor de 100,000 habrá crecido de 13 en 1981 a 18 en 1990. Estas son: Iquitos en Loreto; Huancayo y Huanuco en Andrés Bello; Arequipa en Arequipa; Chimbote en Chavín; Piura y Sullana en Grau; Cuzco en Inca; Tacna, Juliaca y Puno en José Carlos Mariátegui; Ica y Ayacucho en Los Libertadores-Wari; Chiclayo y Cajamarca en Nor-Oriente del Marañón; Trujillo en La Libertad; Pucallpa en Ucayali; y Lima-Callao en Lima. Al incluir las ciudades de Tarapoto y Moyobamba, la población metropolitana habrá alcanzado el 49 por ciento del total nacional en 1990; y entre mujeres en edad fértil, el 55 por ciento.

TAMANO DE LA MUESTRA

El presupuesto original de la ENDES 1991-1992 permitía un tamaño de muestra de aproximadamente 12,000 mujeres. Al fijar la distribución esperada de MEF por región, para establecer las fracciones de muestreo a emplearse, se trabajó con la cifra de 15,000, esperando una pérdida muestral de hasta 20 por ciento por motivos de la no respuesta y la posible inaccesibilidad de ciertos conglomerados por razones de clima, terrorismo y narcotráfico.

La distribución de la muestra según regiones respondió a dos consideraciones. En primer lugar, se quería representar a cada región como un dominio de estudio. En segundo lugar, se quería obtener estimadores confiables a nivel nacional. La mejor distribución de la muestra según el primer criterio habría sido la asignación de 1150 entrevistas a cada una de las 13 regiones. La mejor distribución de la muestra para el segundo criterio habría sido en forma proporcional al número estimado de MEF (170 entrevistas en Ucayali y 5184 entrevistas en Lima, por ejemplo).

Una decisión de representar a cada región con igual número de entrevistas tendría el efecto de incrementar el error estándar de cualquier estimador a nivel nacional en 41 por ciento. En cambio, sería absolutamente inadmisibles tratar de representar a Ucayali con solo 170 entrevistas. La distribución que se adoptó para la ENDES 1991-1992, balancea los dos criterios: permite hacer inferencia a nivel regional mientras que para estimaciones a nivel nacional aumenta el error estándar de cualquier estimador en solo 4 por ciento.

SELECCION DE LA MUESTRA

A continuación se distribuyó el número estimado de entrevistas a tomarse en cada región según METRO y RESTO en forma proporcional al número estimado de MEF en la población total. Luego se fijó el número de unidades primarias de muestreo (UPM) a seleccionarse. En áreas metropolitanas, el muestreo fue bietápico: primero la selección de UPM, y luego la selección de viviendas. La experiencia de otras encuestas ha señalado la conveniencia de seleccionar conglomerados de aproximadamente 15 a 20 MEF en áreas urbanas. Para obtener el número de UPM en el área metropolitana, se dividió el número estimado de entrevistas a tomarse entre 15, redondeando al número par más cercano, para poder aparear conglomerados para cálculos de varianza.

El muestreo en áreas no metropolitanas fue trietápico: primero la selección de distritos como UPM, luego la selección de conglomerados como unidades secundarias de muestreo (USM), y finalmente la selección de viviendas. El número de UPM

seleccionadas resultó de dividir el número estimado de entrevistas entre 60 y redondear al siguiente número par. Luego se procedió a la selección de tres conglomerados por distrito. La selección de UPM y de USM se hizo utilizando probabilidad proporcional al tamaño estimado (PPTE). Las UPM metropolitanas (conglomerados) son grupos de manzanas, o una sola manzana, con un promedio de 100 viviendas. Para la selección tanto de las UPM Metro como de las viviendas, se utilizaron los listados producto de la operación precensal llevada a cabo por el INEI en 1991.

La selección de UPM (distritos) en el dominio no metropolitano se hizo con PPTE, utilizando las proyecciones preparadas por el INEI en 1991 a nivel distrital. La selección de conglomerados (segmentos urbanos o reas de empadronamiento rural, AER), también se hizo con PPTE, utilizando igualmente el material producido por la operación precensal. Los segmentos y AER contienen en promedio unas 100 viviendas.

La técnica de muestreo utilizada en la selección de distritos, conglomerados y viviendas fue sistemática con inicio aleatorio. La única excepción a esta regla fue la selección de viviendas en las AER, donde por razones de seguridad fue preferible emplear segmentos compactos. En cada AER se determinó el número de segmentos a formarse, derivado del cociente entre el número de viviendas listadas y el intervalo de selección para luego seleccionar un segmento con un número aleatorio. En total se seleccionaron 910 conglomerados, 514 en las reas metropolitanas y 396 en los 132 distritos seleccionados para representar al resto del país.

Response Rate

En el proceso de la selección de los distritos para representar al dominio no metropolitano se tuvo que excluir 50 distritos, por no estar en condiciones de ofrecer garantía alguna para los equipos de campo. Más adelante, en el proceso de listado precensal, hubo que reemplazar 16 de los 132 distritos seleccionados originalmente, por el mismo motivo. En su gran mayoría, estos distritos son pequeños en términos de su población y están concentrados en la Sierra Sur y Sierra Central. Aunque es difícil especificar con exactitud la población excluida, se estima que la muestra representa al 95 por ciento de la población peruana.

En términos generales, el rendimiento de la muestra fue bueno, como era de esperarse, porque se trabajaba con listados elaborados poco antes de la encuesta. Las selecciones excluidas de la base para el cálculo de la tasa de respuesta (desocupada, destruida u otro), por ser selecciones "no muestrales", representan solo el 3.9 por ciento del total de selecciones. Para la ENDES de 1986, la cifra comparable era 7.3 por ciento. La tasa total de respuesta, 90 por ciento, compara muy favorablemente con otras encuestas del programa DHS, y es escasamente un punto por debajo de la obtenida en la ENDES de 1986.

Debido a que se utilizaron tasas de muestreo que variaban entre regiones, es necesario usar los datos con ponderaciones que reflejan la probabilidad correcta con que una vivienda o una mujer fue seleccionada para la encuesta. Al mismo tiempo, es conveniente incluir en el cálculo del factor de ponderación la tasa de respuesta obtenida tanto a nivel del hogar como a nivel de la mujer. Cabe tener en cuenta la corrección introducida por falta de cobertura: del total de 910 conglomerados, 9 no pudieron ser visitados, por motivos varios. Las ponderaciones están normalizadas para que sumen al número total de entrevistas, tanto de hogares como de mujeres.

El mayor número de entrevistas de MEF logradas en comparación con el número esperado (15,882 vs. 12,000) se debe en parte a los procedimientos rigurosos aplicados en el campo y en parte a algunas sorpresas en cuanto al rendimiento de la muestra y el trabajo de campo. Referente a los procedimientos, se aplicó el intervalo semi-abierto para encontrar viviendas suplementarias; y dentro de cada vivienda, se indagó por la existencia de hogares adicionales. Como resultado de estas prácticas, el número de hogares encontrados superó en 8.3 por ciento la cantidad de direcciones originalmente enviadas al campo. Esta cifra compara con la de 5.5 por ciento encontrada en la ENDES de 1986, sugiriendo un proceso continuo de muestreo.

Las sorpresas surgen alrededor de dos supuestos básicos que se hicieron al momento de diseñar la muestra: que la relación del número de MEF al total proyectado de la población será de 25 por ciento en las reas metropolitanas y de 20 por ciento en el resto del país; y que habrá una pérdida muestral de 20 por ciento por causa de la no respuesta, inaccesibilidad, etc.

En 20 de los 26 dominios muestrales la relación MEF-personas superó la relación supuesta. Esto se mide en la columna titulada "Mejor captura de MEF", e indica que se encontraron 1096 MEF más que las esperadas. La pérdida muestral, o sea el inverso de la tasa total de respuesta y cobertura, supera el 20 por ciento en solo 3 de los 26 dominios muestrales. La consecuencia de esto está medida en la columna titulada "Mejor tasa de respuesta", indicando una ganancia de 1395 entrevistas. Así, resulta fácil explicar la existencia de 14,491 entrevistas en contra de las 12,000 esperadas. El supervit restante de 1391 entrevistas podrá atribuirse a un sin número de factores, incluyendo la sobre-cobertura. Pero pareciera más realista atribuir el supervit a una proyección de la población que haya subestimado el crecimiento real de la misma.

Questionnaires

Overview

La recolección de información en ENDES 1991-1992 se planeó mediante la utilización de tres cuestionarios: un Cuestionario del Hogar, un Cuestionario Individual y un Cuestionario de Disponibilidad de Servicios. Ellos son versiones adaptadas al Perú de los cuestionarios modelo del programa DHS (Modelo "A" para países con niveles altos en la prevalencia de anticoncepción). En su adaptación para el Perú participó el Comité Técnico. Contribuyeron también miembros de la misión local de la Agencia para el Desarrollo Internacional (USAID) y del Ministerio de Salud con el fin de asegurar que la encuesta captara información que sirva para sus fines programáticos.

a) El Cuestionario del Hogar captó la siguiente información de todas las personas que habitaban permanentemente en el hogar y de aquellos que pernoctaron la noche anterior:

- Sexo
- Edad
- Parentesco con el jefe del hogar
- Actividad principal
- Nivel de instrucción
- Alfabetismo
- Asistencia escolar (incluye asistencia a otros centros de instrucción formal)
- Mortalidad materna

b) El Cuestionario Individual se utiliza en la recolección de información de las mujeres en edad fértil, entre 15 y 50 años, que durmieron la noche anterior al día de la entrevista en la vivienda seleccionada (población de facto o de hecho). Se entrevistaron las mujeres de 50 años como medida de seguridad para evitar desplazamiento en tal variable. El Cuestionario Individual incluye los tópicos que se señalan a continuación:

- Antecedentes de la entrevistada Reproductiva e historia de nacimientos Conocimiento, uso y fuente de obtención de métodos anticonceptivos. Salud materno-infantil y lactancia Nupcialidad Preferencias de fecundidad
- Antecedentes del marido, residencia y trabajo de la mujer
- Mortalidad materna
- Antropometría: peso, talla y perímetro braquial (madres e hijos)

El Cuestionario Individual incluyó un calendario mediante el cual se recogió información detallada sobre eventos importantes en la vida de la mujer, registrados mes a mes desde Enero de 1986: nacimientos, embarazos, terminaciones de embarazos y uso de anticonceptivos (Columna 1 del calendario); motivo de discontinuación de métodos (Columna 2); meses de amenorrea, abstinencia y lactancia (Columnas 3, 4 y 5, respectivamente); historia de uniones (Columna 6); tipo de localidad donde ha vivido (Columna 7); y tipo de trabajo desempeñado (Columna 8). El empleo del calendario permite tener una adecuada secuencia de los eventos y detectar y corregir traslapes indebidos en los tiempos de duración de cada uno de ellos, lo que asegura mejor calidad en los datos.

c) El Cuestionario de Disponibilidad de Servicios de la versión maestra del programa DHS ha sido ampliado y adaptado para hacer un estudio más profundo de la oferta de servicios de salud y planificación familiar, incluyendo aspectos de calidad de los servicios, complementándose así con un estudio de Investigación Operativa para Planeamiento Estratégico que realizará The Population Council en el Perú. Por esta razón su aplicación fue diferida y tendrá lugar en el tercer trimestre de 1992.

DATA COLLECTION NOTES

ENTRENAMIENTO DEL PERSONAL DE CAMPO

El entrenamiento al personal de campo se realizó en dos etapas : en la primera se adiestraron 34 candidatas a supervisoras en un curso de dos semanas, seguido de una prueba piloto (del 15 al 18 de Mayo de 1991) consistente en la entrevista a 200 mujeres entre 15 y 49 años. La experiencia de la prueba piloto permitió efectuar ajustes y modificaciones a los cuestionarios de hogar e individual.

En una segunda etapa se adiestraron 110 candidatas a entrevistadoras durante 40 días. En el curso se explicó el sentido y la importancia de cada pregunta del cuestionario, los procedimientos de entrevista y se realizaron prácticas de prueba en el aula y en el terreno. Al final del entrenamiento se seleccionaron 55 entrevistadoras, 28 supervisoras y 12 operadoras para digitación. Durante la última semana se capacitó a las supervisoras en las técnicas de antropometría (peso, talla y perímetro braquial). En el curso actuaron como profesores profesionales del INEI, del Ministerio de Salud, de centros de investigación no gubernamentales y de la Asociación Benéfica PRISMA, así como los asesores de Macro International.

OPERACION DE CAMPO

Para el trabajo de campo se constituyeron 14 equipos, uno para cada región y 2 en el caso de Lima. Cada uno estuvo conformado por cuatro entrevistadoras, una crítica de campo (encargada de la revisión de los cuestionarios en el mismo terreno), una supervisora (responsable de las mediciones antropométricas y de la conducción del equipo) y un chofer. El personal de campo estuvo constituido, en su gran mayoría, por residentes de las regiones donde se realizaba el trabajo; su adaptación al medio en términos culturales, de clima y ambiente, fue un factor clave para asegurar el contacto con los informantes, lo que permitió evitar el recelo natural que suscitan personas ajenas al lugar, sobre todo en las zonas de emergencia por razones de violencia.

El trabajo de campo se inició el 17 de Octubre de 1991, simultáneamente en las 13 regiones del país y culminó el 7 de Marzo de 1992. La última fase se realizó en Lima, para lo cual se desplazaron allí personas que ya habían concluido el trabajo de su región, conformándose 3 equipos más.

SUPERVISION

Adicionalmente se contó con 5 supervisoras nacionales, del personal permanente del INEI, quienes hicieron un seguimiento del trabajo de cada equipo, desplazándose periódicamente a las regiones.

Data Processing

Data Editing

La primera etapa del procesamiento de la información se implementó en el terreno, donde las críticas de campo verificaban la consistencia de los cuestionarios, aclarando y corrigiendo errores mediante reentrevistas en el campo. Luego, en la oficina central, los lotes de cuestionarios fueron codificados y digitados para proceder con la crítica interactiva mediante microcomputadoras, con el programa ISSA (Sistema Integrado para Análisis de Encuestas) desarrollado dentro del Programa DHS para el procesamiento de encuestas complejas como la ENDES 1991-1992. ISSA se utilizó para completar las siguientes tareas:

1. Consistencia de rangos y control de flujos y relaciones lógicas entre las variables, a medida que se digitan las respuestas, detectando rápidamente errores e inconsistencias que fueron resueltos por las digitadoras (los casos sencillos) o por un equipo especial de analistas de consistencia.
2. Depuración de errores mediante un proceso por lotes, que controla la integridad del archivo de datos e informa acerca de las posibles inconsistencias.
3. Preparación de tabulaciones de control de calidad con el objeto de realizar evaluaciones de la calidad de la información desde los primeros días de trabajo de campo, lo que permite hacer el seguimiento de los equipos y retroalimentar a las supervisoras y entrevistadoras, eliminando así errores sistemáticos.
4. Preparación de tabulaciones de salida, lo que permite la presentación de resultados al poco tiempo de concluido el trabajo de campo.

Other Processing

En la preparación del informe participaron los responsables técnicos por parte de Macro International y el director del Proyecto por parte del INEI. El informe fue realizado en la Sede de Macro International en Columbia, Maryland, Estados Unidos de Norte América, lo que permitió contar con la asesora especializada de sus investigadores y las facilidades de cómputo para realizar corridas adicionales de los programas y así entender mejor las relaciones entre las variables investigadas.

Data Appraisal

Estimates of Sampling Error

En general, los errores estandar son pequeflos y que por ello la muestra puede calificarse como bastante precisa; esto es especialmente claro en la antepenltima columna donde aparecen los errores relativos. Ntese que los efectos del disel~o tienden a aumentar para las clasificaciones geogrficas y a disminuir para clasificaciones que cruzan toda la muestra, como es la edad.

Other forms of Data Appraisal

El propsito del presente apndice es proporcionar al usuario de los datos de la ENDES 1991-1992 una primera visin de la calidad de los mismos. En el Apndice B del Informe Final se presentaron los resultados relacionados con los errores de muestreo. Los cuadros en este Apndice estn referidos ms bien a posibles errores no muestrales: preferencia de dgitos y redondeo en la declaraci3n de edades o fechas; olvido de acontecimientos en el pasado; el esfuerzo deliberado de algunas entrevistadoras de distorsionar algunos datos con el objeto de aligerar la carga de trabajo; la falta de colaboracin de algunas mujeres en facilitar ciertos datos o su rechazo a la medicin antropomtrica, etc. A continuacin se describe brevemente la magnitud de estos errores no muestrales.

Questionnaires

El Cuestionario Individual

Title	El Cuestionario Individual
Author(s)	Instituto Nacional de Estadística e Informática; Asociación Benéfica PRISMA
Date	1991-10-01
Country	Peru
Language	Spanish
Contributor(s)	Macro International Inc.
Description	<p>El Cuestionario Individual se utiliza en la recolección de información de las mujeres en edad fértil, entre 15 y 50 años, que durmieron la noche anterior al día de la entrevista en la vivienda seleccionada (población de facto o de hecho). Se entrevistaron las mujeres de 50 años como medida de seguridad para evitar desplazamiento en tal variable. El Cuestionario Individual incluye los tópicos que se señalan a continuación:</p> <ul style="list-style-type: none"> - Antecedentes de la entrevistada Reproducción e historia de nacimientos Conocimiento, uso y fuente de obtención de métodos anticonceptivos. Salud materno-infantil y lactancia Nupcialidad Preferencias de fecundidad - Antecedentes del marido, residencia y trabajo de la mujer - Mortalidad materna - Antropometría: peso, talla y perímetro braquial (madres e hijos) <p>El Cuestionario Individual incluye un calendario mediante el cual se recogió información detallada sobre eventos importantes en la vida de la mujer, registrados mes a mes desde Enero de 1986: nacimientos, embarazos, terminaciones de embarazos y uso de anticonceptivos (Columna 1 del calendario); motivo de discontinuación de métodos (Columna 2); meses de amenorrea, abstinencia y lactancia (Columnas 3, 4 y 5, respectivamente); historia de uniones (Columna 6); tipo de localidad donde ha vivido (Columna 7); y tipo de trabajo desempeñado (Columna 8). El empleo del calendario permite tener una adecuada secuencia de los eventos y detectar y corregir traslapes indebidos en los tiempos de duración de cada uno de ellos, lo que asegura mejor calidad en los datos.</p>

Encuesta Demográfica y de Salud Familiar 1991/1992 - Informe Final

Title	Encuesta Demográfica y de Salud Familiar 1991/1992 - Informe Final
Author(s)	Instituto Nacional de Estadística e Informática; Asociación Benéfica PRISMA
Date	1992-09-01
Country	Peru
Language	Spanish
Contributor(s)	Macro International Inc.
Description	Este informe presenta los resultados de la Encuesta Demográfica y de Salud Familiar en Perú (ENDES 1991-1992), realizada mediante un esfuerzo del Instituto Nacional de Estadística e Informática (INEI), en el marco de la fase II del programa mundial de las Encuestas de Demografía y Salud (DHS) de Macro International Inc. El programa de encuestas DHS ha sido diseñado para recolectar información sobre fecundidad, planificación familiar y salud materno- infantil. La financiación de la encuesta provino de la Agencia para el Desarrollo Internacional de los Estados Unidos (USAID) a través de la Misión en el Perú y de Macro International (proyecto DPE-3023-Z-00-8074-00). Se contó además con el apoyo del Programa de Desarrollo de las Naciones Unidas (PNUD); el Fondo de Población de las Naciones Unidas (UNFPA); el Fondo de las Naciones Unidas para la Infancia (UNICEF); y la Oficina Panamericana de la Salud (OPS).
