### DISEÑO DE LA MUESTRA

La Encuesta Nacional de Demografía y Salud del Paraguay, ENDS-90, fue implementada en la parte Oriental del país, esto es excluyendo la región Occidental (mejor conocida como el Chaco), debido a la baja densidad poblacional y a su alto grado de dispersión. A pesar de que ambas regiones tienen aproximadamente igual extensión territorial, el 98 por ciento de la población está concentrada en la parte Oriental del país. La muestra fue diseñada para producir aproximadamente 5,000 entrevistas completas de mujeres en edad fértil (15 a 49 años de edad) a ser obtenidas de 6,348 hogares seleccionados asumiendo una tasa general de respuesta del 80 por ciento. Esta es de tipo probabilístico, autorepresentada a nivel de cada dominio: Área Metropolitana y Asunción, Región Norte, Región Centro-Sur, y la Región Este; estratificada dentro de cada dominio: urbano/rural; y bitempica: primero áreas de enumeración y luego hogares. Este diseño permite obtener estimaciones representativas urbano/rural a nivel de cada una de las cuatro regiones.

Como marco de unidades primarias de muestreo (UPM) se usó el listado censal (1982) de áreas de enumeración (AE). Para el dominio de Asunción y el Área Metropolitana se utilizó la muestra generada para la Encuesta de Mano de Obra, la cual por ser una muestra grande, se consideró como una muestra madre para la selección de la muestra de AEs para la ENDS-90. Para los dominios restantes se determinó un total de 58 UPMs dentro de cada dominio, con un promedio de 25 viviendas por UPM. La selección de UPMs fue hecha en forma sistemática y proporcional al número de viviendas censadas en 1982. Después de actualizar las UPMs seleccionadas, los hogares a ser visitados se seleccionaron en forma sistemática (según el intervalo de selección) en la zona urbana y en forma continua en la zona rural, esto es, a partir de una vivienda seleccionada al azar dentro del listado hasta completar el número calculado de viviendas.

Inicialmente la muestra fue distribuida en partes iguales entre los cuatro dominios de estudio, pero posteriormente fue reajustada de acuerdo al listado final de hogares para obtener aproximadamente el número de hogares requeridos en la muestra. La fracción final de muestreo en cada dominio de estudio se observa a continuación.

A pesar de que la muestra es autoponderada dentro de cada dominio, se han obtenido factores de ponderación los cuales restituyen la participación real de cada dominio dentro del total muestral. Así por ejemplo, mientras que las mujeres entrevistadas en la Región Norte constituyen el 22.8 por ciento, el peso de estas mujeres en el total es del 10.8 por ciento, similar al peso de la región en el total nacional.

### RENDIMIENTO DE LA MUESTRA

Se pudo obtener información completa del 90 por ciento de las 6,348 direcciones seleccionadas. En el 4.8 por ciento de los casos no se encontró a los miembros del hogar, en un .6 por ciento hubo rechazo y en el .5 por ciento de los casos no fue posible localizar la vivienda. Un poco más del cinco por ciento de las direcciones seleccionadas resultaron no ser efectivamente viviendas, por estar vacantes o estar destruidas. Puede observarse que no se dan diferencias substanciales entre las zonas rural y urbana o entre regiones en cuanto a ausencia de adultos o rechazos.

En las viviendas donde se logró obtener información, se encontraron 6,262 mujeres elegibles, de las cuales el 93 por ciento pudo ser entrevistada con éxito. El 4 por ciento de las mujeres estaban ausentes y el 1 por ciento rechazó la entrevista. Las restantes mujeres corresponden a entrevistas aplazadas que no pudieron llegar a realizarse y a entrevistas que se completaron solo parcialmente. En los resultados de las entrevistas individuales tampoco se observan diferencias importantes según área de residencia de la mujer.

### TRABAJO DE CAMPO Y ANÁLISIS DE LOS DATOS

La prueba piloto para los cuestionarios de la ENDS-90 se efectuó durante los días 12 al 27 de Marzo de 1990. Diez entrevistadoras fueron entrenadas durante 10 días y luego se recolectó información en un total de 150 encuestas de mujeres elegibles. Algunos ajustes y modificaciones fueron incluidos en el cuestionario basados en la experiencia de la prueba piloto.

Cuatro semanas fueron utilizadas para el entrenamiento principal de la ENDS-90 (Abril 16 a Mayo 12). El entrenamiento se completó con 38 mujeres de las cuales 24 fueron seleccionadas como entrevistadoras, 6 como antropometristas, 6 como supervisoras, y 2 como crítico-codificadoras. El personal del CEPEP y de IRD trabajaron conjuntamente en la conducción del entrenamiento. Representantes del Ministerio de Salud Pública hicieron presentaciones sobre el sistema de salud en Paraguay, y de atención materno-infantil. Durante la tercera semana se implementó el entrenamiento en antropometría (peso y talla) con aquellas personas seleccionadas para este fin.

El trabajo de campo empezó el 21 de Mayo en Asunción con seis equipos y se completó el 24 de Agosto de 1990. Cada equipo estuvo conformado por una supervisora, una antropometrista, cuatro entrevistadoras y un chofer.

La primera etapa del procesamiento de la información se implementó en el terreno, cuando las supervisoras y las editoras de terreno verificaron la consistencia de los cuestionarios. Una vez en la oficina central los cuestionarios pasaron por codificación y revisión manual, siendo luego digitados para proceder con la edición de máquina. Estas actividades de oficina fueron desempeñadas por 4 críticos-codificadores, 4 digitadores, y 3 personas en edición y corrección.

El ingreso y procesamiento de los datos de la ENDS-90 se implementó con el programa ISSA (Sistema Integrado para Análisis de Encuestas). Este es un programa avanzado diseñado para micro-computadoras por el IRD, que permite agilizar el proceso de ingreso de información y de elaboración de tabulaciones y, por lo tanto, hace posible la presentación de resultados al poco tiempo del término del trabajo de campo. Debido a la celeridad con que produce resultados, este programa ha permitido hacer evaluaciones de la calidad de la información a partir de los primeros días de trabajo de campo.

Como en cualquier otra encuesta, siempre se hace necesario el uso de imputación de valores para aquellas variables en que la información es faltante o inconsistente. El procedimiento usado en DHS es la imputación por "hot deck" el cual es un procedimiento dinámico que asigna o imputa la información del caso anterior más cercano o similar al caso inconsistente. En la ENDS-90 la labor de imputación fue mínima dada la calidad de la información recolectada.

Solamente en el caso de la información sobre edad y fecha de la primera unión se detectaron inconsistencias que ameritaron la revisión original de los datos para así decidir sobre los procedimientos de corrección. Dado que el problema fue uno de inconsistencia y no de falta de información, el procedimiento siguiente fue implementado:

- En aquellos casos en que la edad a la primera unión reportada y la edad a la primera unión calculada (usando la fecha a la primera unión) difieren en un año, se asume que la fecha a la primera unión es correcta. Para estos casos, la edad a la primera unión que se incluye en los archivos "recode" es obtenida a partir de la fecha a la primera unión. Nótese que el archivo de datos original contiene esta inconsistencia. Esta inconsistencia se observó en 703 casos, esto es 12 por ciento de las encuestas.

- Cuando las discrepancias entre las edades declaradas y calculadas fueron de más de un año, la revisión y corrección de los casos se implementó manualmente y caso por caso. Esta inconsistencia se observó en 139 casos, de los cuales 62 presentaron diferencias de dos años.

## Response Rate

---

Un total de 6,262 mujeres elegibles fueron identificadas a través del cuestionario de hogar, lográndose completar el cuestionario individual para 5,827 de ellas (93.1 por ciento). Solo un 1.1 por ciento de las mujeres elegibles rechazaron la entrevista, mientras que un número mayor, 4.2 por ciento no fue posible entrevistarlas por estar "ausentes" del hogar.

# Questionnaires

## Overview

---

Dos cuestionarios en Español fueron usados en la ENDS-90, el cuestionario de hogar y el cuestionario individual. Ambos cuestionarios son versiones adaptadas al Paraguay de los cuestionarios modelo, DHS Modelo "A", para ser usado en pases con niveles altos en la prevalencia de anticoncepción.

a) El cuestionario de hogar se use para listar miembros del hogar con residencia habitual y personas de visita, que pasaron la noche anterior a la entrevista en la vivienda. Para todas aquellas personas listadas, se recolecta información sobre la relación con el jefe del hogar, sexo, edad; para personas de 6 o más años de edad se recolecta información sobre asistencia escolar, nivel y grado de instrucción; para personas menores de 15 años de edad se preguntó sobre crianza. El objetivo principal del cuestionario de hogar fue el de identificar mujeres elegibles para la entrevista individual.

b) El cuestionario individual se use para recolectar información de todas las mujeres en edad fértil (MEF), 15-49 años de edad, que durmieron la noche anterior al día de la entrevista, en la vivienda de entrevista (población de facto). Se recolecta información en los tópicos siguientes:

- Antecedentes de la Entrevistada
- Reproducción e Historia de Nacimientos
- Conocimiento y Uso de Métodos Anticonceptivos
- Salud Materno-Infantil y Lactancia
- Nupcialidad
- Preferencias de Fecundidad
- Antecedentes del Marido
- Residencia y Trabajo de la Mujer
- Antropometría: Peso y Talla

## Estimates of Sampling Error

Por tratarse de una encuesta por muestreo, los resultados que se incluyen en el presente informe son estimaciones que están afectadas por dos tipos de errores: aquellos que se producen durante las labores de recolección y procesamiento de la información (que se denominan usualmente errores no de muestreo) y los llamados errores de muestreo, que resultan del hecho de haberse entrevistado sólo una muestra y no la población total.

El primer tipo de error incluye la falta de cobertura de todas las mujeres seleccionadas, errores en la formulación de las preguntas y en el registro de las respuestas, confusión o incapacidad de las mujeres para dar la información, errores de codificación o de procesamiento. En el presente estudio se trató de reducir a un mínimo este tipo de errores a través de una serie de procedimientos que se emplean en toda encuesta bien diseñada y ejecutada, como son: el diseño cuidadoso y numerosas pruebas del cuestionario, buena capacitación de las entrevistadoras, supervisión intensa y permanente del trabajo de campo, supervisión apropiada en la etapa de codificación y procesamiento de los datos y limpieza cuidadosa del archivo. Los elementos de juicio disponibles señalan que este tipo de errores se mantuvo dentro de márgenes razonables en la ENDS-90. En lo que sigue no se hará más referencia a los errores ajenos al muestreo sino únicamente a los llamados errores de muestreo.

La muestra de mujeres estudiadas en la ENDS-90 no es sino una de la gran cantidad de muestras del mismo tamaño que será posible seleccionar de la población de interés utilizando el diseño empleado. Cada una de ellas habrá dado resultados en alguna medida diferentes de los arrojados por la muestra usada. La variabilidad que se observa entre todas las muestras posibles constituye el error de muestreo, el cual no se conoce pero puede ser estimado a partir de los datos suministrados por la muestra realmente seleccionada. El error de muestreo se mide por medio del error estándar. El error estándar de un promedio, porcentaje, diferencia o cualquier otra estadística calculada con los datos de la muestra se define como la raíz cuadrada de la varianza de la estadística y es una medida de su variación en todas las muestras posibles. En consecuencia, el error estándar mide el grado de precisión con que el promedio, porcentaje, o estadística basado en la muestra, se aproxima al resultado que se habría obtenido si se hubiera entrevistado a todas las mujeres de la población bajo las mismas condiciones.

El error estándar puede ser usado para calcular intervalos dentro de los cuales hay una determinada confianza de que se encuentra el valor poblacional. Así, si se toma cierta estadística calculada de la muestra (un porcentaje, por ejemplo) y se le suma y resta dos veces su error estándar, se obtiene un intervalo al cual se le asigna una confianza de 95 por ciento de que contiene, en este caso, el porcentaje poblacional.

Si las mujeres incluidas en la muestra hubieran sido seleccionadas en forma simple al azar, podrían utilizarse directamente las fórmulas muy conocidas que aparecen en los textos de estadística para el cálculo de los errores estándar, límites de confianza y para la realización de pruebas de hipótesis. Sin embargo, como se ha señalado, el diseño empleado es complejo, por lo cual se requiere utilizar las fórmulas que corresponden al diseño, las cuales consideran los efectos de la estratificación y la conglomeración.

En el primer cuadro más adelante se presentan los resultados para las 36 variables consideradas de mayor interés en la encuesta. Para cada variable se incluye el correspondiente valor de  $r$  (sea un promedio o un porcentaje), el error estándar y el número de casos (ponderados y sin ponderar) en la muestra total. Además del error estándar, en el cuadro aparecen también el efecto del diseño (DEFT), el error relativo (ES/ $r$ ) y el intervalo de confianza con 95 por ciento de seguridad.

En general, los errores estándar son pequeños y que por ello la muestra puede calificarse como bastante precisa; esto es especialmente claro en la antepenúltima columna donde aparecen los errores relativos. Nótese la situación que se observa para algunas variables con igual número de casos pero con error relativo mayor que 10 por ciento para una de las variables. Esta situación se debe al número de casos con la característica del valor estimado.

Para ilustrar el uso de las cifras en este cuadro considérese la variable "Residencia Urbana (URBAN)", que tiene un valor de 0.563 con un error estándar de 0.014. Si se desea un intervalo de confianza del 95 por ciento, lo que se hace es sumarle y restarle al promedio dos veces al error estándar:  $0.563 \pm (2 \times 0.014)$ , lo que produce el intervalo de 0.535 a 0.591. Esto significa que se tiene una confianza de 95 por ciento de que el valor de la población total se encuentra entre esos valores que arroja la muestra.

Los resultados básicos por sexo y región de residencia, y grandes grupos de edad de las mujeres se presentan a continuación de los resultados para la población total.

Title	Encuesta Nacional de Demografía y Salud 1990 - Cuestionario del Hogar
Author(s)	Centro Paraguayo de Estudios de Población
Date	1990-05-01
Country	Paraguay
Language	Spanish
Contributor(s)	Institute for Resource Development/Macro Systems, Inc.
Description	El cuestionario de hogar se usó para listar miembros del hogar con residencia habitual y personas de visita, que pasaron la noche anterior a la entrevista en la vivienda. Para todas aquellas personas listadas, se recolectó información sobre la relación con el jefe del hogar, sexo, edad; para personas de 6 o más años de edad se recolectó información sobre asistencia escolar, nivel y grado de instrucción; para personas menores de 15 años de edad se preguntó sobre crianza. El objetivo principal del cuestionario de hogar fue el de identificar mujeres elegibles para la entrevista individual.

Author(s)	Centro Paraguayo de Estudios de Población
Date	1991-09-01
Country	Paraguay
Language	Spanish

Contributor(s)	Institute for Resource Development/Macro Systems, Inc.
Description	Este informe presenta los resultados de la Encuesta Nacional de Demografía y Salud de Paraguay (ENDS-90), realizada en 1990 mediante un esfuerzo del Centro Paraguayo de Estudios de Población (CEPEP), en el marco de la fase II del programa mundial de las Encuestas de Demografía y Salud (DHS) del Institute for Resource Development, IRD. El programa de encuestas DHS, ha sido diseñado para recolectar información sobre fecundidad, planificación familiar, y salud materno-infantil. La financiación de la encuesta provino de la Agencia para el Desarrollo Internacional de los Estados Unidos (USAID) a través de IRD (proyecto DPE-3023-Z-00-8074-00) y el CEPEP. Se contó además con el apoyo de la Misión de USAID en Paraguay; de la Organización Panamericana de la Salud (OPS); la International Planned Parenthood Federation (IPPF); y de la Misión Alemana de Cooperación Técnica en el Paraguay.
