Sampling

Sampling Procedure

The sampling methodology was designed to make the sample nationally representative. In order to achieve this, a two-stage clustered stratified sampling procedure was used to select the households to be included in the sample. In 25 transition countries, France, Germany, Italy and Sweden, the survey was conducted face-to-face in 1,000 randomly chosen households. In Russia, Ukraine, Uzbekistan, Serbia, Poland and the United Kingdom there were 1,500 household interviews in order to allow for a reasonably large sample for a follow-up telephone survey, which will be based on a shortened version of the current questionnaire and which will be conducted one year after the face-to-face survey, i.e., in autumn 2011.

In the first stage of the sampling, sample frame of Primary Sampling Units were established. In all countries, the most recent available sample frame of Primary Sampling Units (PSUs) was selected as the starting point. Local electoral territorial units were used as PSUs wherever it was possible, as they tend to carry the most up-to-date information about household addresses. The following sampling frames were used:

Electoral districts: Bulgaria, Hungary, Poland, Romania, Serbia.

Polling station territories: Albania, Armenia, Belarus, Bosnia and Herzegovina, Moldova, Montenegro.

Census Enumeration Districts: Slovak Republic, Sweden, Tajikistan, Turkey.

Geo-administrative divisions: the remaining countries.

The second stage in sampling consisted of selecting households within each PSU. The aim was to make sure that each household was selected with an equal probability within any given PSU and hence all households in the country had the same probability of being selected. Two sampling procedures were used. In the majority of countries, a random walk fieldwork procedure was used: the fieldwork coordinator selected the first address to be sampled, and the interviewer was given clear instructions on how to select remaining addresses within the PSUs. For a small number of countries - Hungary, Lithuania, Slovenia and Sweden and the United Kingdom - the sample was pre-selected to ensure that the probability of any household's inclusion was always equivalent to the probability generated by random selection.

The sampling procedures are more fully described in "Life in Transition Survey 2010 - Final Report" pp.114-115.

Response Rate

The standard interview method called for each selected household to be visited at least three times before being replaced. In the majority of cases (79 percent), however, the interviews were completed on the first visit. In 61 percent of cases, the head of the household and the principal respondent were the same person; in the remaining 39 percent, two different interviews were required to be carried out in the same household.

Weighting

In all countries, except for France, Poland and Sweden, there is a significant majority of females and relatively older people in the sample. This is likely to have resulted from the fact that household members who were away from home on a permanent basis, either for work or studies, were excluded from the sample.

In order to correct this problem, a weighting scheme was introduced. In the first step, the weighting scheme identifies target populations in each country, disaggregated by age and gender. In the second step, weights are assigned in order for the sample to reproduce the gender and age breakdown within the country's population. All the figures presented in this report are weighted using this scheme.

Using 'democratic' weights, all countries are weighted by their population. With 'federal' weights, all countries are weighted equally.

Questionnaires

Overview

The questionnaire of LiST II includes sections on the impact of the crisis and on climate change issues, as well as improved and expanded questions in areas such as corporate governance, public service delivery, and economic and social attitudes.

There are 8 Sections in the questionnaire: Household Roster, Housing and Expenses, Attitudes and Values, Climate Change, Labour, Education and Entrepreneurial Activity, Governance, Miscellaneous Questions, and Impact of the Crisis.

The respondents of the questionnaire are the head of the households or other knowledgeable household members for section 1 and 8. For sections 3-7, the respondents are the people selected randomly by using selection grids.

How Reliable and Consistent Are Subjective Measures of Welfare in Europe and Central Asia?

Title	How Reliable and Consistent Are Subjective Measures of Welfare in Europe and Central Asia?
Author(s)	Alexandru Cojocaru, Mame Fatou Diagne
Date	2013-02-01
Country	Europe and Central Asia
Language	English

Description This paper analyzes the reliability and consistency of subjective well-being measures. Using the Life in Transition Survey, which was administered in 34 countries of Europe and Central Asia in 2006 and 2010, the paper evaluates subjective well-being measures (satisfaction with life and subjective relative income position) against objective measures of welfare based on consumption and assets. It uses the different formulations of life satisfaction in the survey to test robustness to alternative framing and scaling. It also explores within-household differences in subjective well-being assessments. The analysis finds that subjective relative income is weakly correlated with household relative welfare position as measured by consumption or assets. Life satisfaction, by contrast, is highly correlated with objective and subjective measures of household welfare. It generally reflects cross-country differences in average consumption, assets, or per capita gross domestic product, although Central Asian countries report much higher life satisfaction levels than their incomes would suggest. Two alternative measures of life satisfaction are highly correlated and the correspondence between verbal and numeric scales is strong within a country or groupings of similar countries. Within households, subjective assessments of relative income are roughly consistent but measurement error is correlated with individual characteristics (gender and age of respondents), which could cause systematic biases in the analysis.

This paper is a product of the Poverty Reduction and Economic Management Unit, Europe and Central Asia Region. It is part of a larger effort by the World Bank to provide open access to its research and make a contribution to development policy discussions around the world. Policy Research Working Papers are also posted on the Web at <http://econ.worldbank.org>. The authors may be contacted at acojocaru@worldbank.org or mfdiagne@worldbank.org.
