## Sampling Procedure

### Marco Muestral

Dado que el diseño para la Encuesta ENDES Continua 2009 - 2011 es bietápica, se utiliza un marco muestral en cada una de las etapas de la selección de las unidades de muestreo.

Para la primera etapa: selección de UPM (conglomerados), se utiliza la información del Censo de Población y Vivienda del 2007. Para la segunda etapa: selección de USM (viviendas), se utiliza el marco muestral proveniente de la actualización cartográfica y registro de edificios y viviendas realizada previamente a las entrevistas, con el objetivo de identificar y registrar cambios en las áreas seleccionadas. Producto de este proceso se tiene un registro actualizado de viviendas que en ese momento existan en el área, el cual constituye el marco de muestreo para la selección de viviendas.

En la práctica, se debe considerar periódicamente un proceso de actualización debido a que con el transcurso del tiempo el número de viviendas contenidas en cada una de las áreas puede cambiar. Este sistema de actualización permite incorporar periódicamente al marco de muestreo en la segunda etapa las nuevas viviendas que aparecen en el proceso de expansión urbana y asignarle una probabilidad no nula de pertenecer a la muestra.

### Muestra Panel de Conglomerados

La Muestra Panel para la ENDES Continua 2009 - 2011 es de conglomerados, a diferencia de otros estudios de encuestas llamadas paneles clásicos, que tienen una muestra permanente de personas que responden a un cuestionario en periodos de tiempos fijos, lo que permite seguir la evolución de los indicadores en el tiempo. Entre las ventajas de esta aplicación se puede enumerar las siguientes:

- Posibilidad de estimar cambios (entre los conglomerados paneles de la encuesta) con mayor precisión, utilizando la correlación entre muestras paneles.
- Facilita el trabajo de campo, ya sea para la ubicación del conglomerado, o búsqueda de hogares.
- Reducción de esfuerzos en relación a los trabajos de actualización cartográfica y registro de viviendas.
- Mayor tiempo destinado a la supervisión del recojo de la información.

### Unidades de Muestreo

En el área Urbana, las unidades de muestreo son:

- La Unidad Primaria de Muestreo (UPM), representada por el conglomerado el cual es el área geográfica conformado por una o varias manzanas que en conjunto tienen 120 viviendas particulares, en promedio.
- La Unidad Secundaria de Muestreo (USM), es la vivienda particular que integra la UPM seleccionada.

En el área Rural, las unidades de muestreo son:

- La Unidad Primaria de Muestreo (UPM), es de dos tipos:
  - o El conglomerado el cual está conformado por una o varias manzanas que en conjunto tienen 120 viviendas particulares, en promedio,
  - o El AER (área de empadronamiento rural) el cual está conformado por uno o varios centros poblados rurales que en conjunto tienen 120 viviendas particulares (por lo general dispersas en el terreno).
- La Unidad Secundaria de Muestreo (USM), es la vivienda particular que integra la UPM (AER seleccionado).

### Composición de la Muestra

El objetivo inicial fue obtener aproximadamente 24200 entrevistas completas de mujeres elegibles, se utilizó información de la ENDES 2000 para estimar ciertos parámetros del diseño, especialmente las tasas de respuesta. Por ello, se ha estimado un total de 27756 viviendas a ser seleccionadas para obtener el número antes mencionado de entrevistas completas.

(Consulte el Apéndice A en el informe final)

## Response Rate

---

De un total de 1132 conglomerados seleccionados, se logró implementar la encuesta en todos ellos.

De los 27756 hogares que fueron seleccionados, se logró entrevistar a 26739 hogares, con una tasa de respuesta de hogares de 99,1 por ciento, tasa que varía ligeramente de acuerdo al departamento. Las tasas más bajas se encontraron en Lima y Tacna (96,1 y 96,9 por ciento respectivamente) y las más altas en los departamentos de Ucayali (100,0 por ciento).

De un total de 23055 mujeres elegibles, se lograron entrevistar a 22525, obteniéndose una tasa de respuesta individual de 97,7 por ciento. Las mayores tasas de respuesta se lograron en los departamentos de Amazonas (99,3 por ciento), San Martín (99,2 por ciento), Ucayali (99,1 por ciento) y Arequipa (99,1 por ciento) y las más bajas en Lima, la Provincia Constitucional del Callao, Madre de Dios y Cusco en proporciones que varían entre 94,8 y 96,3 por ciento.

## Weighting

---

Para que las estimaciones derivadas de la ENDES 2011 sean representativas de la población, es necesario multiplicar los datos de cada hogar muestral contenido en los archivos por el peso o factor de ponderación calculada según el diseño muestral.

El factor final para cada hogar tiene dos componentes: el factor básico de muestreo y factor de ajuste por la no respuesta. El factor básico de expansión es determinado por el diseño de la muestra y equivale al inverso de la probabilidad final de selección de cada hogar. Esto quiere decir que los factores de básicos de expansión varían según el departamento de estudio.

Finalmente, el factor de ajuste por no respuesta es utilizado para ajustar los factores básicos de muestreo con el objetivo de tomar en cuenta los hogares no entrevistados en el conglomerado. Este ajuste a los factores básicos es realizado a nivel de departamento.

# Questionnaires

## Overview

---

La información se recogió en dos cuestionarios: uno para investigar las características de vivienda y el hogar y un cuestionario individual dirigido a las mujeres de 15 a 49 años que permite obtener información sobre sus características demográficas y de salud y de sus hijos menores de cinco años.

## Estimates of Sampling Error

Por tratarse de una encuesta por muestreo, los resultados de la ENDES 2011 que se incluyen en el presente informe son estimaciones que están afectadas por dos tipos de errores: aquellos que se producen durante las labores de recolección y procesamiento de la información (que se denominan usualmente errores no muestrales) y los llamados errores de muestreo, que resultan del hecho de haberse entrevistado sólo una muestra y no la población total.

El primer tipo de error incluye la falta de cobertura de todas las mujeres seleccionadas, errores en la formulación de las preguntas y en el registro de las respuestas, confusión o incapacidad de las mujeres para dar la información y errores de codificación o de procesamiento. Al igual que para las encuestas anteriores de 1991-1992, 1996, 2000, 2004-2006, 2007-2008, 2009, 2010 y 2011 se trató de reducir a un mínimo este tipo de errores a través de una serie de procedimientos que se emplean en toda encuesta bien diseñada y ejecutada, como son: el diseño cuidadoso y numerosas pruebas del cuestionario, intensa capacitación de las entrevistadoras, supervisión ardua y permanente del trabajo de campo, revisión de los cuestionarios en el campo por parte de las críticas, supervisión apropiada en la etapa de codificación, y procesamiento de los datos y limpieza cuidadosa del archivo con retroalimentación a las supervisoras, críticas y entrevistadoras a partir de los cuadros de control de calidad. Los elementos de juicio disponibles señalan que este tipo de errores se mantuvo dentro de márgenes razonables en la ENDES 2011. En lo que sigue no se hará más referencia a los errores ajenos al muestreo sino únicamente a los llamados errores de muestreo.

La muestra de hogares visitados para la ENDES 2011 no es sino una de la gran cantidad de muestras del mismo tamaño que será posible seleccionar de la población de interés utilizando el diseño empleado. Cada una de ellas habrá dado resultados en alguna medida diferentes de los arrojados por la muestra usada. La variabilidad que se observara entre todas las muestras posibles constituye el error de muestreo, el cual no se conoce pero puede ser estimado a partir de los datos suministrados por la muestra realmente seleccionada. El error de muestreo se mide por medio del error estándar. El error estándar de un promedio, porcentaje, diferencia o cualquier otra estadística calculada con los datos de la muestra, se define como la raíz cuadrada de la varianza de la estadística y es una medida de su variación en todas las muestras posibles. En consecuencia, el error estándar mide el grado de precisión con que el promedio, porcentaje, o estadística basado en la muestra, se aproxima al resultado que se habría obtenido si se hubiera entrevistado a todas las mujeres de la población bajo las mismas condiciones.

El error estándar puede ser usado para calcular intervalos dentro de los cuales hay una determinada confianza de que se encuentre el valor poblacional. Así, si se toma cierta estadística calculada de la muestra (un porcentaje, por ejemplo) y se le suma y resta dos veces su error estándar, se obtiene un intervalo al cual se le asigna una confianza de 95 por ciento de que contiene, en este caso, el porcentaje poblacional.

Si las personas entrevistadas en la ENDES 2011 hubieran sido seleccionadas en forma simple al azar, podrían utilizarse directamente las fórmulas muy conocidas que aparecen en los textos de estadística para el cálculo del error estándar y de los límites de confianza y para la realización de pruebas de hipótesis. Sin embargo, como se ha señalado, el diseño empleado es complejo, por lo cual se requiere utilizar fórmulas especiales que consideran los efectos de la estratificación y la conglomeración.

## Other forms of Data Appraisal

Calidad de la información

- Distribución por edad de la población en hogares en la muestra total
- Distribución por edad de las mujeres elegibles y entrevistadas
- Porcentaje de observaciones sin información en la muestra básica
- Nacimientos a mujeres en la encuesta individual por año calendario
- Edad al fallecimiento en días para menores de 1 mes en la entrevista a mujeres
- Edad al fallecimiento en meses para menores de 2 años en la entrevista a mujeres

(Consulte el Apéndice C en el informe final)

Apéndice C: Los cuadros en este apéndice están referidos a posibles errores no muestrales, entre los que se puede citar a la preferencia de dígitos y redondeo en la declaración de edades o fechas; olvido de acontecimientos en el pasado; el esfuerzo deliberado de algunas entrevistadoras de distorsionar algunos datos con el objeto de aligerar la carga de trabajo; la falta de colaboración de algunas mujeres en facilitar ciertos datos o su rechazo a preguntas formuladas, etc. En este marco, se incluyen los cuadros básicos con el detalle de la magnitud de estos errores no muestrales.
