Sampling

Sampling Procedure

Sampling
A sampling frame, i.e. a plan showing areas in which households must be selected for inclusion in the survey sample, has been scientifically worked out for the study, as well as the sampling technique, i.e. the process by which specific houses are to be selected for interviewing. The recruiting fieldworker will be given detailed specifications and will be specially trained to select the households for the survey. Interviewers will be given lists of the names of the occupant families of households, the addresses of the houses, and the approximate number of household members to be interviewed in each case, as well as the appointed dates and times of interviews, which they will follow.

Information was collected from a stratified sample consisting of 294 households (103 Black; 126 Coloured; and 65 White) by means of four questionnaires: one directed at 121 adults of 55 years and older; one at 573 younger adults between 18 and 54 years of age; and two focused on health (including anthropometric measurements) of 812 adults and 294 children.

Weighting

Weights are the inverse of the probability of selection of the household (which were calculated when the sample EAs were drawn) times the inverse of the response rate (which may be interpreted as an inverse probability of selection under the assumption that observations are missing at random within EA's). This product summed across the 294 households to an arbitrary number approximately equal to the total number of households in the Langeberg district. The weights were rescaled to sum across completed households to the sample size, 294, by dividing each weight (the product) by the mean weight for the 294 cases. The Rescaled weight is the weight adjusted for non-response in the survey and the Rcensus weight is the Rescaled weight adjusted to 1996 population census proportions.

Questionnaires

Overview

Five modules have been constructed (which constitute the questionnaire, or survey instrument) which were used by the interviewers to collect information from household members (respondents) during interviews in the respondents' home.
• A Household Module
• An Older Adult Module
• A Younger Adult Module
• A Health Measurements Module

The Household Module administered to the household head, or a person who is knowledgeable about all the members of the household and the household's income and expenditures.

The Older Adult Module administered to all members of the household aged 55 years and over.

The Young Adult Module administered to all members of the household aged 18-54 years.

The Health Measurements Module completed for all members of the household aged 18 years and over.

The survey instrument used was one that had been developed over a four year period and was the joint product of researchers at the University of Cape Town (Monica Ferreira, HSRC/UCT Centre for Gerontology, Karen Charlton, Nutrition and Dietetics Unit; and Jaqui Goldin, SALDRU); University of the Western Cape (Pieter le Roux, Economics); University of the Witwatersrand (Merton Dagut, and Martin Wittenberg, Faculty of Commerce); Rhodes University (Valerie Moller); the Medical Research Council (Krisela Steyn and Debbie Bradshaw); Princeton University (Anne Case and Angus Deaton, Economics and Woodrow Wilson School); Harvard University (Robert Jensen, Kennedy School of Government, and David Bloom, School of Public Health); MIT (Courtney Coile, Economics); the Health Systems Trust (Dr John Gear) and the Western Cape Provincial Dept. of Health (Drs. Najma Shaikh, Mike Hendricks & Ingrid le Roux) together with other persons in the medical community of South Africa. This team of gerontologists, economists, public health experts and physicians grappled with the survey design, both structure and content, through many rounds of piloting, until there was consensus that the questionnaire worked well in the field.

DATA COLLECTION NOTES

Interviewing

For the purpose of this study, interviewing is a technique whereby an interviewer poses set questions to an individual who qualifies for inclusion in the sample and records the responses on the questionnaire (or in this case, in the modules). An interviewer arrives at a sampled (recruited) house at an appointed time; introduces the study and its aims to the respondents - specifically the household head, if available; thanks the respondents for their willingness to be interviewed; assures the respondents that whatever information is divulged by them will be kept absolutely confidential; identifies the head of the household and the most knowledgeable person (see Section 8 for definitions); poses set questions to the respondents - the questions are listed in the modules; records the answers in the appropriate spaces in the modules; probes for more information, or verifies information, where required; ensures that the interview proceeds in a congenial way; checks that all required information has been obtained; and then thanks the respondents warmly at the end of the interview, or on completion of the module(s) that were administered to them. Some terms and processes relating to interviewing are explained briefly.

All variables. These had been mislabelled as being from Section I but were from Section E. These were renamed replacing
"QI" with "QE".

Remaining Data Quality Issues
After corrections to the data by DataFirst, remaining identified data quality issues with the dataset are that the variables
identified in the files below do not have corresponding questions in the questionnaires for the survey:
