# Sampling

## Sampling Procedure

---

The South African population of persons 18 years and older was stratified according to:

Province (Western Cape, Eastern Cape, Northern Cape, Orange Free State, Natal/KwaZulu, Eastern Transvaal, PWV, North Western Province, Northern Transvaal)

Socio-economic classification:

Rural areas in former self-governing and TBVC states

Squatter areas in former non-white urban (metro and non- metro areas)

Hostels and hotels

Former urban areas for coloureds

Former urban areas for a Asians

Former urban areas for blacks

Former urban (non- metro) areas for whites

Former urban (metro) areas for whites

Rural areas, excluding the former self-governing and TBVC states

The sample allocation to these strata was done roughly proportional to the adjusted 1991 population census figures with a few exceptions, among which was to ensure a minimal provincial total of 120. Multistage stratified cluster (probability) sampling was used to draw the respondents with the adjusted 1991 population census figures as measure of size. Census enumerator areas and similar areas were used as the clusters in the pen-ultimate sampling stage, from which an equal number, viz. one or two by four households were drawn. All clusters were drawn with probability proportional to size, whilst households were drawn from the final clusters with equal probability (systematically). Respondents were drawn at random from qualifying household members. In addition, population of live-in domestic workers was sampled in relation to their residence in already drawn households.

## Weighting

---

The sample design allocation per population group was not proportional to the population figures as given in the adjusted 1991 census figures as well as updated figures for certain areas such as the former TBVC states. The population total for each region and socioeconomic category was divided by the actual realisation in the particular cell. The figure derived is the pre-weight that was used. The data was weighted for the age group 18 years and older, in other words, the population that qualified as respondents.

The aim of the factor weighting was to correct the disproportions which were incorporated in the sample design (minimum number of 120 respondents per province, over-sampled population of Asians) and the only weighting targets were stratification variables: 'province' and 'socio-economic category'.

## Data Collection

### Data Collection Dates

Start	End	Cycle
1994-10-10	1994-10-28	N/A

### Data Collection Mode

Face-to-face [f2f]

#### DATA COLLECTION NOTES

MarkData of the Human Sciences Research Council conducted the fieldwork for the survey.

Fieldwork area: The fieldwork was done on a countrywide basis, including all nine provinces.

Fieldwork period: Fieldwork was conducted from 10 to 28 October 1994. During this period the interviewers were trained by the fieldwork organisers, the interviews were conducted and the completed questionnaires were collected and checked.

Method of data collection: The data was collected by interviewers specifically trained in personal interviewing. The respondents were scientifically selected and interviewed at home.

The interviews were often conducted after hours to ensure that the scientifically drawn person was present. If the drawn person was not home during the first visit, but was available during the fieldwork period, an appointment was made and the person concerned revisited. If nobody in the household qualified, or was available during the fieldwork period, the household was substituted.

The questions in the questionnaire were printed in both English and Afrikaans. These were translated by the interviewers into the relevant languages of the black fieldwork areas. Interviews were conducted in the respondent's choice of language.
