Sampling

Sampling Procedure

A sample survey of 1000 randomly- selected Cape Metropolitan Area residents was designed. First, a list of all Enumerator areas falling within the CMA was obtained from the Statistics South Africa office in Cape Town. Secondly, the number of Cape Metropolitan Enumerator areas falling within each magisterial district was counted and a stratified random sample of 25 settlement areas (using electronically- generated random number selection techniques) was selected. Thirdly, detailed EA maps (showing residential units, streets names as well as public and other non-residential buildings) were obtained from Statistics South Africa for each of the 25 selected areas and 40 dwelling units were selected on a random spatial basis from each of these enumerator areas maps.

Face-to-face [f2f]

DATA COLLECTION NOTES

The data was gathered through an analysis of secondary sources (written and verbal). Qualitative information was collected from 25 locations in the study's focus area. Within each of these 25 areas, semi-structured interviews were completed with three residents on the migration histories of their families; a key informant was identified and interviewed regarding the recent history of the area; and a focus group discussion was organised in order to probe local issues relevant to migration into and out of the area. A questionnaire was used in a sample survey in the focus area, comprising 991 cases. Time series information on homesteads (dwelling units) was obtained from aerial photographs in a selected number of areas.
