Sampling

Sampling Procedure

A sample survey of 2016 randomly-selected WC provincial residents was designed. First, a list of all Enumerator Areas (EAs) falling within the province ($n=7203$) was obtained from the Statistics South Africa (SSA) office in Cape Town. These EAs are available according to District (and Unicity). Secondly, using random selection techniques, EAs were selected in the six geographic Districts shown in the table (A.1) below. These were then listed, identified as settlement areas in terms of their urban places' former group area racial classification and rank-ordered so as to conform to the needs of the table below. Subsequently, for those entered into the table, EA maps were obtained from SSA and dwelling units shown on each map were selected on a random spatial basis. 32 dwellings in each EA were selected in this fashion. The survey research team subsequently visited each of these areas during the period July - October 2001. 1621 survey interviews were completed, in the dominant language of the neighbourhood (Afrikaans, Xhosa or English).

Questionnaires

Overview

A questionnaire which had been applied in earlier migration studies was used as a point of departure to develop a questionnaire for the survey. This instrument focused on households and was designed so that the head of household (HoH) provides information about other members of the household as well as the migration history of the household (assumed to be the same as the migration history of the HoH respondent). Two separate datasets are generated by using such an instrument – one comprising household data and a second individual data. The questionnaire was designed to cover the following relevant issues: household member and socio-economic data, housing and infrastructure, migration history of HOH, issues relating to social capital, retirement plans and potential for ‘moving on’, and HoH attitudes to migration.
