Sampling

Sampling Procedure

The area probability sample included a primary sample of South Africans of all races and a boost sample of white South Africans. Representative subsamples of at least 250 respondents of most major racial, ethnic, and linguistic groups were also included.

The sampling was divided into two parts – a primary sample, including South Africans of all races, and a boost sample of white South Africans. In the main sample, 3,139 interviews were completed. The Boost Sample was composed only of white South Africans, with a control for language (English versus Afrikaans). A total of 588 additional whites was interviewed.

Response Rate

The overall response rate for the survey was approximately 87 percent (after treating “break-offs” as unsuccessful interviews). The main reason for failing to complete the interview was inability to contact the respondent; refusal to be interviewed accounted for approximately 27 percent of the failed interviews. From the response rate alone, the representativeness of the sample seems assured. Such a high rate of response can be attributed to the general willingness of the South African population to be interviewed, the large number of call-backs we employed, and the use of an incentive for participating in the interview (the incentive was a magnetic torch (flashlight), with which the respondents were quite pleased).

Weighting

Because the various racial and linguistic groups were not selected proportional to their size in the South African population, it is necessary to weight the data according to the inverse of the probability of selection. In addition, post-stratification weights have been applied to the final data in order to make the sample more representative of the South African population. After correcting for unequal probabilities of selection, the data have been post-stratified according to three variables: (1) size of place of residence; (2) the respondent's age; and (3) the respondents race. Size of place of residence is a trichotomy: (1) metro areas; (2) other urban areas (cities, large towns, and small towns); and (3) rural areas (villages, farms, and kraals). Age categories were defined as (1) 18-24 years old; (2) 35-44 years old; (3) 45-54 years old; (4) 55-64 years old; and (5) 65 years old and older. The four major racial groups in South Africa were used. After trimming the weight, and adjusting the weights to the actual number of completed interviews (3,727), the post-stratification weight variable ranges from .29 to 2.02.

Two weight variables are included in the dataset. One weight variable (NATWT) should be used when analysis is not conducted by race, and the other (RACEWT) when conducting analyses including respondent race.

Questionnaires

Overview

The questionnaire for the Survey of Truth and Reconciliation in South Africa, 2000-2001 includes individual characteristics, respondent awareness, knowledge, and approval of the activities of the TRC, how important it was for respondents to find out the truth about the past and achieve racial reconciliation.
