Overview

ABSTRACT

The Living Standards Measurement Survey (LSMS) is a multi-purpose household survey conducted to measure living conditions and poverty situation, and to help policymakers in monitoring and developing social programs.

LSMS has been carried out in Albania in the context of continuing monitoring of poverty and the creation of policy evaluation system in the framework of the National Strategy for Development and Integration (previously the National Strategy for Economic and Social Development).

The first Albania LSMS was conducted in 2002, followed by 2003, 2004, 2005, 2008 and 2012 surveys. In 2012, 6,671 households participated in the survey.

Sampling

Sampling Procedure

The survey includes a sample of 6,671 households that constitute the survey units. The sample is chosen randomly by two rounds of selection. The sample frame was provided from Population and Housing Census done on October 2011. In the first round, 834 Primary Selection Units (PSUs) have been chosen randomly to represent the whole territory of the country. Then, 8 households for each PSU were chosen to be interviewed in the second round through a procedure of systematic sample. To handle cases of non response or no contact other 4 households for each PSU were chosen as substitutes that ensured the target of 6,671 completed questionnaires near the households.

The methodology of the 2012 LSMS has been kept similar with the surveys conducted in the previous years. However, the geographic domains of analysis have been expanded to include the 12 individual prefectures of Albania, by urban and rural strata, compared to four geographic regions (Central, Coastal, Mountain and Tirana) by urban and rural strata defined previously as domains for the survey. This required a considerable increase in the sample size from 3,600 to 6,671 households making possible to calculate indicators of living standard for 24 strata and even for the four main areas of the country in order to compare the regional results to those from the 2002, 2005 and 2008 surveys and study the regional trends for various indicators.

Questionnaires

Overview

The questionnaire was divided in two sections, and was administered to households in two visits, one section per visit. During the second visit the interviewer would also collect additional information of use for the eventual tracking of the household in the next waves of the panel.

The Booklet for Recording Daily Household Consumption was left with the household by the interviewer during the first visit for the household to compile, and collected during the second visit. Upon collection, interviewers took care of checking the entries (also with the help of a checklist provided at the end of the booklet) and correct them as appropriate with the help of the most knowledgeable person in the household.

A specific column was provided for the household to record the reference period for any purchases of food. The checklist was compiled by the interviewer, with the help of the most knowledgeable person in the household, upon collection of the diary. Interviewers were instructed to check, for 14 main food staples, whether any consumption of the item had been recorded in the diary. Whenever an item had not been recorded the interviewer would ask the respondent to report whether the item (a) had not been used in the 14-day period, or (b) had been consumed but the household had forgotten to record its consumption, or else (c) had been consumed by the household drawing on stocks purchased or produced outside the 14-day period. If the inclusion of an item had simply been forgotten the interviewer would then fill the appropriate section of the diary by asking the household to recall the details of that consumption. If the household reported consuming an item purchased before the beginning of the 14-day period, then information on the frequency of purchase, quantity, unit of measure and value of the purchase were recorded in the columns provided to this end in the checklist.
