# Sampling

## Sampling Procedure

---

The sample design used for the JSLC was derived from the Labor Force Survey. The LFS sampling strategy is a two stage stratified process designed to select approximately one and a half percent of the dwellings in Jamaica. In the first stage, enumeration districts are selected from a geographic frame. In the second, households are selected from the frame of dwellings in the enumeration district. The sample is self-weighted, that is each household in Jamaica is equally likely to be included in the survey sample. From 1988 through 2000, there have been four versions of the LFS sample design which have been used as the basis of the JSLC sample.

# Questionnaires

## Overview

---

Unlike many LSMS surveys, the JSLC does not include price and community questionnaires. Because Jamaica is small and has a good transport network, regional price variation was expected to be small and, for this reason, price data were not collected. Much of the distance to, and availability of, services and infrastructure that is usually gathered in the LSMS community questionnaire is collected in the JSLC's household, health services and school questionnaires described below.

**Core Questionnaire :** For each round of the JSLC, the household questionnaire has included modules covering health, education, anthropometric measurements for all children less than five years old, daily expenses, consumption expenditures, non-consumption expenditures, food expenses, consumption of home production, housing, an inventory of durable goods, other household income, and food stamps. Employment and job search information for all adults age 14 or older is available from the Labor Force Survey. The JSLC household questionnaire was completed in one interview approximately one month after the Labor Force Survey. The JSLC questionnaire has undergone substantial revision since 1988, reflecting accumulated experience and changing demands for data. For example, the food stamps and other income modules were added after the 1988 survey, in which these subjects were addressed only briefly in the housing module.

### DATA COLLECTION NOTES

Unlike many LSMS surveys, the JSLC does not include price and community questionnaires. Because Jamaica is small and has a good transport network, regional price variation was expected to be small and, for this reason, price data were not collected. Much of the distance to, and availability of, services and infrastructure that is usually gathered in the LSMS community questionnaire is collected in the JSLC's household, health services and school questionnaires described below.

The JSLC interviews are conducted between rounds of the LFS using STATIN personnel, computers, and vehicles. The STATIN household survey personnel include four senior supervisors, sixteen supervisors and eighty interviewers. For the JSLC, they are organized into sixteen teams of five interviewers and one supervisor each.

### SUPERVISION

Four senior supervisors are located in Kingston, High Gate, Linstead and Black River (in the south, north, center and west of the country, respectively). Their responsibilities are largely administrative. The supervisor is responsible for: 1) the review of each completed questionnaire for inconsistencies; 2) observation of some interviews; 3) field checks of some completed questionnaires; 4) verification of dwellings recorded as vacant or closed; 5) visiting nonresponding households to encourage cooperation; and 6) taking the anthropometric measurements.

# Data Processing

## Data Editing

---

Data entry is done in The Surveys and Computer Systems Divisions in the Statistical Institute of Jamaica (STATIN) by its own data entry operators. The cleaning process (after the questionnaires have left the field) has been standardized since 1989-2. Before data entry, the questionnaires are edited and coded, where necessary, by the Editors-Coders at STATIN. The number of questions that require coding in the office is intentionally kept very low. Clerical errors are removed, where possible, and checks are made for consistency using the data entry program. The area classification is then checked using a computer program.
