1.0 Introduction

The purpose of the present document is to provide detailed information on the panel survey component of the General Household Survey (GHS) fielded by the National Bureau of Statistics (NBS) in 2015-2016. This survey is the third wave of a panel survey of households. The GHS-Panel is the result of a partnership that the NBS has established with the Federal Ministry of Agriculture and Rural Development (FMA&RD), the National Food Reserve Agency (NFRA), the Bill and Melinda Gates Foundation (BMGF), and the World Bank (WB). The ability to follow the same households over time makes the GHS-Panel a new and powerful tool for studying and understanding income generating activities and socio-economic outcomes in Nigeria. The GHS-Panel is the first panel survey to be carried out by NBS.

The GHS survey is a cross-sectional survey of 22,000 households carried out periodically throughout the country. Under the work of the partnership, a full revision of the questionnaire was undertaken and, at the same time, a sub-sample of the GHS was randomly selected to form the sample of the GHS-Panel. The GHS-Panel consists of 5,000 households of the GHS collecting additional data on agricultural activities, other household income activities, and household expenditure and consumption. As the focus of this panel component is to improve data from the agricultural sector and link this to other facets of household behaviour and characteristics, the GHS-Panel questionnaire drew heavily on the Harmonized National Living Standards Survey (HNLSS – a multi-topic household survey) and the National Agricultural Sample Survey (NASS – the key agricultural survey). The third wave of the GHS-Panel was carried out in two visits (post-planting visit in September – November 2015 and post-harvest visit in February-April 2016).

This GHS-Panel is part of a larger, regional project in Sub-Saharan Africa to improve agricultural statistics. Nigeria is one of the eight countries being supported by the WB, through funding from the BMGF, to strengthen the production of household-level data on agriculture. This regional project, the Living Standards Measurement Study-Integrated Surveys on Agriculture (LSMS-ISA) has the over-arching objective of improving our understanding of agriculture in Sub-Saharan Africa – specifically, its role in household welfare and poverty reduction.

The present document is designed to provide an overview of the Wave 3 GHS-Panel. Wave 3 consisted of two visits to the household: the post-planting visit occurred directly after the planting season to collect information on preparation of plots, inputs used, labour used for planting, and other issues related to the planting season for the agriculture questionnaire as well as administer a household and community questionnaire. The post-harvest visit occurred after the harvest season and collected information on crops harvested, labour used for cultivating and harvesting activities, and other issues related to the harvest cycle for the agriculture questionnaire. A household and community questionnaire were also administered in the post-harvest visit.

The Basic Information Document for the GHS-Panel 2010/2011 (Wave 1) and 2012/2013 (Wave 2) both contain additional background information and should be used in conjunction with this document.

2.0 The Survey Instruments

The GHS-Panel Wave 3 consists of three questionnaires for each of the two visits. The *Household Questionnaire* was administered to all households in the sample. The *Agriculture Questionnaire* was administered to all households engaged in agricultural activities such as crop farming, livestock rearing and other agricultural and related activities. The *Community Questionnaire* was administered to the community to collect information on the socio-economic indicators of the enumeration areas where the sample households reside.¹

GHS-Panel Household Questionnaire: The Household Questionnaire provides information on demographics; education; health (including anthropometric measurement for children and child immunization); labour and labour data collection options; food and non-food expenditure; household nonfarm income-generating activities; food security and shocks; safety nets; housing conditions; assets; information and communication technology; and other sources of household income. Household location is geo-referenced in order to be able to later link the GHS-Panel data to other available geographic data sets (See Section 7.2.6 and Appendix 4). The labour module of the Household Questionnaire introduced four different variants to test the sensitivity of labour statistics to how labour modules are designed.

GHS-Panel Agriculture Questionnaire: The Agriculture Questionnaire solicits information on land ownership and use; farm labour; inputs use; GPS land area measurement and coordinates of household plots; agricultural capital; irrigation; crop harvest and utilization; animal holdings and costs; and household fishing activities. Some information is collected at the crop level to allow for detailed analysis for individual crops.

GHS-Panel Community Questionnaire: The Community Questionnaire solicits information on access to infrastructure; community organizations; resource management; changes in the community; key events; community needs, actions and achievements; and local retail price information.

The Household Questionnaire is slightly different for the two visits. Some information was collected only in the post-planting visit, some only in the post-harvest visit, and some in both visits. See Section 7.2.2 for more details.

The Agriculture Questionnaire collects different information during each visit, but for the same plots and crops. See Section 7.2.3 for more details.

The Community Questionnaire collected prices during both visits, and different community level information during the two visits. See Section 7.2.4 for more details.

The contents of each questionnaire for the GHS-Panel post-planting and GHS-Panel post-harvest are outlined below.

¹ The Community Questionnaire does not collect information from communities in the sociological sense. The data cannot be used to represent communities in Nigeria. The data collected at the community level represent information that is common to the households selected for inclusion in the selected sample enumeration areas (EAs).

Table 2.1: GHS-Panel Household Wave 3 Questionnaire – Post Planting Visit

| Section | Topic | Respondent | Description |
|----------------|---------------------------------|---|--|
| Cover | Cover | Field staff | Household identifier variables, enumerator, supervisor, and data entry clerk identifiers, date and time of interview and data entry, and observation notes by enumerator regarding the interview |
| 1 | Roster | Household head or spouse. | Roster of individuals living in the household, relationship to the household, gender, year of birth, age, marital status, spouse identification, parental status, and place of birth. |
| 3 | Labour | Individuals 5 years and above | Labour market participation during the last seven days, wage work, and domestic activities within the home |
| 4A | Savings and Insurance | Individuals 15 years and above | Savings made, insurance, and remittances by the household during the last six months, and conditions of the transaction |
| 4B | ICT – Mobile Phone Banking | Individuals 10 years and above | Data on mobile phone access and usage habits |
| 4C | Credit | Individuals 15 years and above | Data on credit history including loans received, loans pending, or loan refusals |
| 5 | Household assets | Household head | Ownership of assets and value |
| 7A | Meals Away From Home | Most knowledgeable person | Naira value of food consumed outside the home during the last seven days. |
| 7B | Household Food Expenditure | Person responsible for food purchases | Quantity and value of food consumed within the household during the last seven days. |
| 8 | Household Non-food Expenditures | Person responsible for household purchases | Non-food expenditure during the last week/last month/last six months/last 12 months |
| 9 | Food Security | Household head or eligible adult | Food security status of households in during the past 7 days/12 months |
| 9B | Subjective wellbeing | Senior female or person most knowledge about food consumption | Data on the stability of food consumption required to meet nutritional needs |
| 11 | Housing | | Data on homeownership and characteristics of home (e.g. type of roof, floor, number rooms, heating source) |

Table 2.2: GHS-Panel Agriculture Wave 3 Questionnaire – Post Planting Visit

| Section | Topic | Respondent | Description |
|----------------|------------------------|--|---|
| Cover | Cover | To be completed by field Staff. Household ID must be copied from Household to Agriculture Questionnaire. | This section contains household location and identification data as well as administrative data as regards administering and managing the questionnaire |
| 11A | Plot Roster | Owner or manager of plot | Information on all plots owned and/or managed by the Household. This section includes data on estimated area, GPS measured area and the GPS measured location of the plot |
| 11B1 | Land Inventory | Owner or manager of plot | Data on plot acquisition, tenure and use |
| 11C1 | Planting Labour | Owner or manager of plot | Information on household members and hired labour that worked in planting activities on the plot. Includes information on amount of time spent by each person and payments made to hired labour |
| 11E | Seed acquisition | Owner or manager of plot | Data on source, quantity and cost of seeds used on the plot |
| 11F | Planted field crops | Owner or manager of plot | Data on crops planted on the plot, amount of crops planted and expected harvest. Also includes questions on cowpeas, variety, features and year of adoption |
| 11I | Animal holdings | Farmer or caretaker of animals | Data on farm animals owned by the household and commercial activity with these animals |
| 11J | Animal costs | Farmer or caretaker of animals | Livestock farmer caretaker activities and costs |
| 11K | Agriculture by-product | Farmer or caretaker of animals | Trading activity in agricultural by-products |
| 11L1 | Extension Services I | Owner or manager of plot | Main source (government and non-governmental) of farming advice on select agricultural activities |
| 11L2 | Extension Services II | Owner or manager of plot | Details of information provided by main source of information on agricultural activities. Includes frequency of visits and usefulness of the information provided |
| 12 | Network Roster | Farmer, owner or manager of plot | Roster of places or businesses where the household sells and purchases agricultural produce and/or supplies |

Table 2.3: GHS-Panel Community Wave 3 Questionnaire – Post Planting Visit

| Section | Topic | Respondent | Description |
|----------------|-----------------------------|------------------------------------|----------------------------|
| Cover | Cover | To be completed by the field staff | Cover |
| C1 | Respondents Characteristics | Community Focus Group | Respondent characteristics |
| C2 | Food Prices | Market Food Sellers | Food prices |
| C3 | Labour | Community Focus Group | Labour |
| C4 | Land Prices and Credit | Community Focus Group | Land prices and credit |

Table 2.4: GHS-Panel Household Wave 3 Questionnaire – Post Harvest Visit

| Section | Topic | Respondent | Description |
|----------------|-------------------|--|--|
| Cover | Cover | To be completed by the field staff | Household identifier variables, enumerator, supervisor, and data entry clerk identifiers, date and time of interview and data entry, and observation notes by enumerator regarding the interview |
| 1 | Roster | Head of Household or spouse. | Roster of individuals living in the household, relationship to the household, gender, year of birth, age, marital status, polygamous marriages, spouse identification, parental status, place of birth, date joined household if new, migration. |
| 2 | Education | Individuals 5 years and above | Educational attainment, school characteristics, and expenditures. |
| 3 | Labour | Individuals 5 years and older | Labour market activity and information on employment in one or more industries in the past 6 months of all household members 5 years and older. This includes employment and earnings information. |
| 4 | Health | All individuals | General health status, utilization and cost of health services for those that need medical care. Data on effect of disabilities on activity and functioning; and anthropometrics. Child immunization records. |
| 4B | Child Development | Mother or primary caretaker of each child between 2 and 18 yrs | Information about ability to communicate and motor skills |
| 6 | Remittances | All individuals 10 years and above | Remittances received from abroad by household members 10 years and older |

| Section | Topic | Respondent | Description |
|----------------|----------------------------|--|--|
| 6A | Behaviour | Head of household, spouse, or other senior member | Data on household preferences |
| 6B | Attitude | Head of household or other senior member | Data on emotional or mental state |
| 10B | Food Expenditures | Female in the household responsible for food preparation and/or food purchases | Data on the content and cost of meals prepared by the household in the past 7 days |
| 10C | Aggregate Food Consumption | Female in the household responsible for food preparation and/or food purchases | Data on the content of meals consumed by the household in the past 7 days overall and by various age groups |
| 11 | Non-food Expenditures | Most knowledgeable person or person who is responsible for household purchases | Consumption and expenditure on non-food items |
| 12 | Food Security | Household head or knowledgeable adult household member | Collects information on quantity of food, preferred foods and variety of foods available to household members based on economic reasons. Also collects data on intra-household food security dynamics. |
| 13 | Other household Income | Household head or knowledgeable adult household member | Miscellaneous income received by household |
| 14 | Safety Nets | Household head or knowledgeable adult household member | Household access to and utilization of safety nets |
| 15A | Economic Shocks | Household head or knowledgeable adult household member | Data on economic shocks affecting the household |
| 15B | Deaths | Household head or knowledgeable adult household member | Deaths of household members in the past 12 months, including age of deceased and cause of death. |
| 15C | Conflict | | Data on the frequency of various types of violence experienced by any member of the household |

Table 2.5: GHS-Panel Agriculture Wave 3 Questionnaire – Post Harvest Visit

| Section | Topic | Respondent | Description |
|----------------|--------------------------------------|--|--|
| Cover | Cover | To be completed by field Staff. Household ID must be copied from Household to Agriculture Questionnaire. | This section contains household location and identification data as well as administrative data as regards administering and managing the questionnaire |
| A1 | Land | Farmer, owner or manager of plot | Follow-up on use of land for in post-planting visit and data on any subsequent planting or other use of the plot. Also information collected on new plots (i.e. added since post-planting visit) |
| A2 | Labour | Farmer, owner or manager of plot | Information on household members and hired labour that worked in crop harvesting activities on the plot. Includes information on amount of time spent by each person and payments made to hired labour |
| 11C2 | Input Cost | | Information about pesticide use, herbicide use, animal traction, equipment and machinery use |
| 11D | Fertilizer Acquisition | | Left over (inorganic fertilizer), free (inorganic fertilizer), source of commercial (inorganic fertilizer), organic fertilizer use |
| A3 | Agricultural production/ disposition | Farmer, owner or manager of plot | Quantity and value of field crops produced |
| A4 | Agricultural Capital | Farmer, owner or manager of plot | Ownership and value of agricultural machinery and tools owned by the household |
| A5 | Extension Services | Farmer, owner or manager of plot | Access to and utilization of technical support from various sources (government and non-government) |
| A8 | Other Agricultural Income | Farmer or caretaker of animals | Income from sale of agricultural products not capture previous section under crops and livestock |
| A9 | Fishing | Owner of fishing operations | Data on fishing activities, includes capture, harvesting and processing. Information on boat usage and the use of hired labour |
| A10 | Network Roster | Farmer, owner or manager of plot | Roster of places or businesses where the household sells and purchases agricultural produce and/or supplies |

Table 2.6 GHS-Panel Community Wave 3 Questionnaire – Post-Harvest Visit

| Section | Topic | Respondent | Description |
|---------|---|------------------------------------|---|
| Cover | Cover | To be completed by the field staff | Cover |
| C1 | Respondents Characteristics | Community Focus Group | Respondents Characteristics |
| C2 | Community Infrastructure and Transportation | Community Focus Group | Community Infrastructure and Transportation |
| C3 | Community Organizations | Community Focus Group | Community Organizations |
| C4 | Community Resource Management | Community Focus Group | Community Resource Management |
| C5 | Community Changes | Community Focus Group | Community Changes |
| C6 | Community Key Events | Community Focus Group | Community Key Events |
| C6A | Conflict | Community Focus Group | Data on violent events occurring in the community |
| C7 | Community Needs, Actions, and Achievements | Community Focus Group | Community Needs, Actions, and Achievements |
| C8 | Food Prices | Market Food Sellers | Food Prices |

There were some changes made in the questionnaires between Waves 2 and 3 to improve the questionnaire while still maintaining comparability between the two waves as much as possible. When questions were dropped or added, every effort was made to keep question numbers consistent with previous waves. If new questions were added in the middle of a section, letters were added to the question number (for example a new question added between Q21 and Q22 would be Q21a). Tables 2.7 and 2.8 outline these changes for the post-planting and post-harvest visits, consecutively.

Table 2.7: Wave 2 to Wave 3 Comparison, Post-Planting

| Questionnaire | Section | Notes |
|-------------------------|-----------------------------|--|
| Household Questionnaire | Section 1: Household Roster | Questions re-ordered in Wave 3: starting with Q7 |
| | | Questions added in Wave 3: Q13b, Q13c |
| | | Question dropped in Wave 3: Q15, Q33, A35-42 |
| | Section 2: Education | Section dropped |
| | Section 3A: Labour | Wave 3: consolidated into Section 3 |
| | | Questions added in Wave 3: Q5b, Q5c, Q6b, Q6c, Q12b, Q15b-Q15f, Q28b-Q28f, |
| | | Questions dropped in Wave 3: Q12, Q19, Q20, Q32, Q33, |

| Questionnaire | Section | Notes |
|---------------------------|--|--|
| | Section 3B: Labour 6 Months, 12 Months, Activity Table, and Activity Summary | Wave 3: consolidated into Section 3 |
| | Section 4: Credit and Savings | Appear as two sections in Wave 3: Section 4a – Savings and Insurance and Section 4c - Credit |
| | | Section 4a – Savings and Insurance, Change in Wave 3: Q11-Q15 replaced |
| | Section 4B: Financial Capability | Removed in Wave 3 |
| | Section 4B: ICT – Mobile Phone Banking | Added in Wave 3 |
| | Section 5: Household Assets | No changes |
| | Section 6: Nonfarm Enterprises and Income Generating Activities | Removed from Wave 3 (information is only collected in post-harvest Section 9). |
| | Section 7A: Meals Away from Home | No changes |
| | Section 7B: Food Expenditure | Change in Wave 3: Changes to food and unit codes |
| | Section 8: Non-Food Expenditure | Change in Wave 3: Changes to recall codes |
| | Section 9: Food Security | No changes |
| | Section 9B: Subjective Wellbeing | New section in Wave 3 |
| | Section 10: Other household income | Removed in Wave 3 |
| | Section 11: Housing | New section in Wave 3 |
| Agriculture Questionnaire | Section 11A: Plot Roster | Questions added in Wave 3: Q4a, Q4b |
| | Section 11B1: Land Inventory | Question re-worded or options modified in Wave 3: Q4, Q9 |
| | | Questions added in Wave 3: Q8a, Q8b, Q9a, Q16b, Q19a, Q28a, Q47-Q51 |
| | Section 11B2: Land Tenure | Dropped in Wave 3 |
| | Section 11C1: Planting Labour | Section Renamed – “Labour” in Wave 3 |
| | | Addition directions to reference Section 11B1, Question 27 for cultivated plots in Wave 3 |

| Questionnaire | Section | Notes |
|-------------------------|---------------------------------------|---|
| | | Questions added in Wave 3: Q11 and Q12 |
| | Section 11C2: Input Cost | Moved to Post Harvest in Wave 3 |
| | Section 11D: Fertilizer Application | Moved to Post Harvest in Wave 3 |
| | Section 11E: Seed Acquisition | Questions added in Wave 3: Q3a, Q3b |
| | Section 11F: Planted Field Crops | Section renamed Planted Field and Tree Crops |
| | | Question modified in Wave 3: Q4 |
| | | Q4 is Q12 in Wave 3 |
| | | Questions added in Wave 3: Q13 – Q15 |
| | | Questions dropped in Wave 3: Q5 – Q12 |
| | Section 11G: Planted Tree Crops | Combined with 11F in Wave 3, starting at Q4 |
| | Section 11H: Marketing | Dropped in Wave 3 |
| | Section 11I: Animal Holdings | Questions dropped in Wave 3: Q1, Q2 |
| | | Condition “in new year” dropped in Wave 3: Q9 – Q21 |
| | Section 11J: Animal Costs | No change |
| | Section 11K: Agriculture By-Product | Condition “in new year” dropped in Wave 3: Q1 |
| | Section 11L1: Extension Services I | No change |
| | Section 11L2: Extension Services II | Referred to as Extension Services 2 in Wave 3 |
| | Section 12: Network Roster | No change |
| Community Questionnaire | Section 1: Respondent Characteristics | No change |
| | Section 2: Food Prices | Change in Wave 3: additional item codes differ |
| | | Q1 starts at Q7 in Wave 3 |
| | | Q1 – Q6 collect geographical information about the main sources of food (i.e. marketplace, shops, or other) |
| | Section 3: Labour | Q14 – Q23 dropped in Wave 3 |
| | | Wave 3 include additional activity codes |
| | Section 4: Land Prices and Credit | No change |

Table 2.8: Wave 2 to Wave 3 Comparison, Post-Harvest

| Questionnaire | Section | Notes |
|---------------|--|---|
| | Cover | Wave 3 adds: AG1 – AG3 |
| | Section 1: Household Roster | Change in Wave 3: adds Q5, Q12a-Q12c |
| | | Questions dropped in Wave 3: Q10 |
| | | Q14 moved to Q4a |
| | Section 2A: Education – New Members | Appears as Section 2 in Wave 3 |
| | | Wave 3 drops Q11, Q12, Q28 |
| | Section 2B: Education – Original Household Members | Wave 3 consolidates 2A and 2B into single Section 2. Education only collected in post-harvest. |
| | Section 2: Education | Single education section in Wave 3 |
| | Section 3A: Labour | Wave 3 consolidates 3A and 3B into single Section 3 |
| | | Q1 appears as Q4 in Wave 3, subsequent questions are re-ordered thereafter |
| | | Questions dropped in Wave 3: Q12, Q16, Q17, Q24b, Q28, Q29, Q33, Q34, Q36-38 |
| | | Questions added in Wave 3: Q28b, Q28c, Q28d, Q28e, Q28f |
| | | Q30b appears as Q35 in Wave 3 |
| | | Q39 time code changed |
| | Section 3B: Labour – 12 Months | Wave 3 consolidates 3A and 3B into single Section 3 |
| | | Begins at Q42 in Wave 3, time codes are reformatted |
| | Section 3: Labour | New to section Wave 3, consolidates 3A and 3B from Wave 2 |
| | | Adds new Q1 confirming if the household member is 5 years or older |
| | Section 4A: Health | Added to Wave 3: Q37a |
| | | In Wave 3 Q51 modified to: “a child aged less than 84 months (less than 7 years)” |
| | | Dropped in Wave 3: Q22e, Q24-Q34, Q36, Q40-Q50 |
| | Section 4B: Child Immunization | Not included in Wave 3 |
| | Section 4: Health | Section 4A as specified above is included in this section |
| | Section 4B: Child Development | New to Wave 3 |
| | Section 5: Information and Communication Technology | Not included in Wave 3 |
| | Section 6: Remittances | Dropped in Wave 3: Q3, Q7 |

| Questionnaire | Section | Notes |
|---------------------------|---|--|
| | Section 6A: Behavior | New to Wave 3 |
| | Section 6B: Attitude | New to Wave 3 |
| | Section 7: Household Assets | Not included in Wave 3 (Only collected in post-planting) |
| | Section 8: Housing | Now collected in post-planting Section 11 |
| | Section 9: Nonfarm Enterprises and Income Generating Activities | Change in Wave 3: Added - Q4a, Q13, Q27a; New response options - Q10, Q13 |
| | Section 10A: Meals Away From Home | No Change |
| | Section 10B: Food Expenditure | Change in Wave 3: modified food item and unit codes |
| | Section 10C: Aggregate Food Consumption | No change |
| | Section 11: Non-food expenditure | Change in Wave 3 item options (e.g. one-month recall) |
| | Section 12: Food Security | No change |
| | Section 13: Other Household Income | Q6 in Wave 3 includes additional condition of “past 12 months” |
| | Section 14: Safety Nets | Wave 3 includes an additional item codes |
| | Section 15A: Economic Shocks | No change |
| | Section 15B: Deaths | No change |
| | Section 15C: Conflicts | New to Wave 3 |
| Agriculture Questionnaire | Section A1: Land and Dry Season Planting | Section renamed “Land” in Wave 3 |
| | | Added to Wave 3: Q4b, Q10a – Q10c |
| | | Dropped in Wave 3: Q26 – Q28 |
| | Section A2: Harvest Labour | Renamed “Labour” in Wave 3 |
| | | New component – Hired Labour between planting and harvesting using same convention as other sections, expect: Q1 split into Q1a and Q1b in Wave 3, Q2 – Q4 appear as Q1c – Q1e in Wave 3 (respectively), Q5 – Q7 appear as Q1f – Q1h in Wave 3 (respectively), Q8 – Q10 appear as Q1i – Q1k in Wave 3 (respectively) |
| | | Question reassigned to the following number in Wave 3: Q10b to Q1l, Q11 to Q1m, Q12 to Q1n, Q13 to Q1o |
| | | Added to Wave 3 – Household Labour (For Harvesting and Threshing) |

| Questionnaire | Section | Notes |
|-------------------------|--|--|
| | | Added to Wave 3 – Hired Labour (For Harvesting and Threshing) |
| | Section 11C2: Input Cost | Moved from post-planting in Wave 3 |
| | Section 11D: Fertilizer Acquisition | Moved from post-planting in Wave 3 |
| | Section A3i: Agricultural Production – Harvest of Field and Tree Crops | Assigned subsection A3i in Wave 3 and renamed “Crop Harvest” |
| | | Added in Wave 3: Q4, Q4a, Q6, Q6a – Q6e |
| | | Number change to in Wave 3: Q6B to Q6e |
| | | Dropped in Wave 3: (modified) versions of Q7 appear in A3ii |
| | Section A3ii: Agricultural Production – Crop Disposition | New to Wave 3 |
| | Section A4: Agricultural Capital | Added in Wave 3: Q3b |
| | Section A6: Animal Holdings | Moved to Post-planting in Wave 3 |
| | Section A7: Animal Cost | Moved to Post-planting in Wave 3 |
| | Section A5a: Extension Services (Topics) | No changes |
| | Section A5b: Extension Services (Sources) | No changes |

| | Section C8b: Food Prices 2nd Location | Geolocation information captured by Q1 – Q6 in Wave 3 |

3.0 Wave 3 Sample and Weights

The baseline GHS-Panel sample of 5,000 households was designed to be representative at the national level as well as at the zonal level (both rural and urban). Therefore, there are 12 strata consisting of urban and rural areas for the six geopolitical Zones. The sample size of the GHS-Panel is not adequate for state-level estimates. The baseline (Wave 1) survey weights were calculated based upon the sampling design to provide representative estimates for the 12 strata. For Wave 3, the Wave 1 weights were adjusted to account for attrition of households. However, given the longitudinal nature of the survey, the weights were not adjusted for population growth and therefore the sample households still represent the frame at the time of the baseline survey. The complete sampling information for the GHS-Panel is described in the Basic Information Document for GHS-Panel 2010/2011.

The objective of the GHS-Panel Wave 3 was to re-interview all of the Wave 2 households. An effort was also made to locate and interview Wave 1 households that were not interviewed during Wave 2. If a household had moved from the location where they were found in the previous interview, the survey teams attempted to track and interview this household in its new location.

Table 3.1 shows the details of the Wave 3 sample. The Wave 3 sample size for households interviewed in both post-planting and post-harvest visit is 4581. This size is only 135 households less than Wave 2. However, there were some households that were not interviewed in Wave 2 that were found and interviewed in Wave 3.

Table 3.1: Details of GHS-Panel Sample in each Wave

| | Wave 1 | | | Wave 2 | | | Wave 3 | | |
|---------------|--------|-------|-------|--------|-------|-------|--------|-------|-------|
| | All | Urban | Rural | All | Urban | Rural | All | Urban | Rural |
| North Central | 794 | 217 | 577 | 784 | 214 | 570 | 777 | 210 | 567 |
| North East | 797 | 138 | 659 | 741 | 117 | 624 | 643 | 106 | 537 |
| North West | 898 | 170 | 728 | 878 | 156 | 722 | 882 | 163 | 719 |
| South East | 794 | 204 | 590 | 763 | 197 | 566 | 755 | 193 | 562 |
| South South | 769 | 229 | 540 | 761 | 219 | 542 | 744 | 221 | 523 |
| South West | 864 | 611 | 253 | 789 | 562 | 227 | 780 | 556 | 224 |
| Total | 4916 | 1569 | 3347 | 4716 | 1465 | 3251 | 4581 | 1449 | 3132 |

4916 is the number of households that are in Wave 1 post-planting **and** Wave 1 post-harvest
4716 is the number of households that are in Wave 2 post-planting **and** Wave 2 post-harvest
4581 is the number of households that are in Wave 3 post-planting **and** Wave 3 post-harvest

Table 3.2 shows the size for three different samples. The first is the sample of households interviewed in both visits for all three waves. The second is the sample of households interviewed in both visits of Wave 1 and Wave 3. The third is those interviewed in both visits of Wave 2 and Wave 3. The full, balanced panel (across all three waves) consists of 4,407 households. For the

Wave 1 and 3 sample there are 4,533 households while for the Wave 2 and Wave 3 sample there are 4,448 households.

Table 3.2: GHS-Panel Sample for Combinations of Waves

| | Wave 1, Wave 2, & Wave 3 | | | Wave 1 & Wave 3 | | | Wave 2 & Wave 3 | | |
|---------------|--------------------------|-------|-------|-----------------|-------|-------|-----------------|-------|-------|
| | All | Urban | Rural | All | Urban | Rural | All | Urban | Rural |
| North Central | 767 | 206 | 561 | 772 | 207 | 565 | 772 | 209 | 563 |
| North East | 592 | 85 | 507 | 641 | 104 | 537 | 593 | 86 | 507 |
| North West | 868 | 153 | 715 | 880 | 163 | 717 | 870 | 153 | 717 |

| South South | 710 | 204 | 506 | 722 | 213 | 509 | 730 | 211 | 519 |
| South West | 732 | 521 | 211 | 766 | 546 | 220 | 743 | 529 | 214 |
| Total | 4407 | 1355 | 3052 | 4533 | 1423 | 3110 | 4448 | 1376 | 3072 |

Table 3.3: Sample Attrition

| | Attrition (# of households) | | | | | | | | |
|---------------|-----------------------------|-------|-------|------------------|-------|-------|---------------------|-------|-------|
| | Baseline* to Wave 2 | | | Wave 2 to Wave 3 | | | Baseline* to Wave 3 | | |
| | All | Urban | Rural | All | Urban | Rural | All | Urban | Rural |
| North Central | 16 | 6 | 10 | 12 | 5 | 7 | 23 | 10 | 13 |
| North East | 59 | 23 | 36 | 148 | 31 | 117 | 157 | 34 | 123 |
| North West | 22 | 14 | 8 | 8 | 3 | 5 | 18 | 7 | 11 |
| South East | 37 | 13 | 24 | 23 | 9 | 14 | 45 | 17 | 28 |
| South South | 39 | 21 | 18 | 31 | 8 | 23 | 56 | 19 | 37 |
| South West | 111 | 78 | 33 | 46 | 33 | 13 | 120 | 84 | 36 |
| Total | 284 | 155 | 129 | 268 | 89 | 179 | 419 | 171 | 248 |

*The original 5,000 households selected for the GHS-Panel.

Note: In all cases the columns represent the households that left the sample between the listed waves.

Therefore, the "Wave 2 to Wave 3" represents that household present in the Wave 2 sample that were not present in the Wave 3 sample.

Since the GHS-Panel is a panel survey, every effort is made to maintain as many households as possible in the sample. However, there is also some attrition for a variety of reasons. The left side of Table 3.3 shows the attrition between the baseline (the original 5,000 households selected for the sample) and Wave 2 as well as between Wave 2 and Wave 3. The additional attrition that occurred between Wave 2 and 3 was 268 households. This is slightly smaller than the attrition between the baseline and Wave 2. The overall attrition between baseline and Wave 3² was 419 households, or about 8.4 percent. A large majority of the additional households lost between Wave 2 and Wave 3 were lost as a result of the poor security situation in the North East Zone. More than half of the additional attrition was concentrated in this Zone. As a result of the security situation, 14 EAs could not be visited in Borno and Yobe States in Wave 3. As shown in Table

² The attrition between baseline and Wave 3 excludes households that were interviewed in Wave 1 and Wave 3 but not Wave 2.

3.4, those 14 EAs contained 137 households that could not be interviewed. Other reasons for attrition are also contained in Table 3.4. Fifty-seven households could not be located or any information about their current location acquired. An additional 25 households refused to continue to participate in the survey.

Table 3.4: Reason for Attrition (Between Wave 2 & 3)

| Reason | # of HH |
|--------------------------|---------|
| Single Household EA | 1 |
| Refused | 25 |
| Not found | 57 |
| Dead | 40 |
| Moved away (not tracked) | 8 |
| Crisis area | 137 |

In order to retain households that had moved away between the post-planting and post-harvest visits, two tracking exercises were conducted following the post-planting visit and again the post-harvest visit. Table 3.5 shows the number of households that were successfully tracked in both of these visits. A total of 186 and 48 households were successfully tracked following the post-planting and post-harvest visits, respectively. Tracking was more substantial following post-planting since households that had moved since Wave 2 (over two years prior) were being tracked whereas for post-harvest only households that had moved between post-planting and post-harvest of Wave 3 were being tracked. As in Wave 2, the tracking was largely concentrated in the southern Zones, especially South West.

Table 3.5: Distribution of Household Interviewed in Tracking Phase

| | <i>Wave 3 Tracking</i> | | | | | |
|---------------|------------------------|-------|-------|---------------------|-------|-------|
| | Post-Planting | | | Post-Harvest | | |
| | All | Urban | Rural | All | Urban | Rural |
| North Central | 10 | 4 | 6 | 5 | 1 | 4 |
| North East | 15 | 4 | 11 | 6 | 3 | 3 |
| North West | 9 | 3 | 6 | 1 | 1 | 0 |
| South East | 25 | 13 | 12 | 3 | 1 | 2 |
| South South | 37 | 13 | 24 | 12 | 3 | 9 |
| South West | 90 | 68 | 22 | 21 | 13 | 8 |
| Total | 186 | 105 | 81 | 48 | 22 | 26 |

When a sample of households is selected for a survey, these households represent the entire population of the country. To accurately use the datasets, the data must be weighted to reflect the distribution of the full population in the country and the original sampling frame. The main weighting procedure is described in more detail in the Wave 1 Basic Information Document. In Wave 3, we also provide a detailed description in Appendix 5 of this document. The original Wave 1 weights were adjusted to account for attrition but were not adjusted to reflect population

changes. All households were assigned weights based upon the EA they resided in during the sample selection. Therefore, a tracked household that moved from EA “A” to EA “B” would still be considered a part of EA “A” for the purpose of survey weight determination.

The survey weights use in any analysis should reflect the relevant sample that is being analysed. For example, when analysing data exclusively from the post-planting module in Wave 3, then it is best to use a weight that is specific to the sample of households interviewed in that visit. In order to provide a more comprehensive set of weights, we provide different survey weights for 6 different samples in Wave 3. Table 3.6 lists the relevant samples, the variable name for the survey weights, and the data files that contain the weights. In order to prevent confusion and follow the same procedure used in Wave 2, only the Wave 3 (*wt_wave3*) and full panel (*wt_w1_w2_w3*) weights are included in the household cover sheet files (*secta_plantingw3.dta* and *secta_harvestw3.dta*). The full set of available weights (including from Wave 1 and Wave 2) are included in *HHTrack.dta*.

Table 3.6: Survey Weight Samples, Variable Names, and Locations

| Sample | Variable name | Location (data file) | |
|-----------------------------|--------------------|----------------------|---------------------------------|
| | | <i>HHTrack</i> | <i>Cover sheets (secta_...)</i> |
| Wave 3, post-planting visit | <i>wt_w3v1</i> | X | |
| Wave 3, post-harvest visit | <i>wt_w3v2</i> | X | |
| Wave 3, both visits | <i>wt_wave3</i> | X | X |
| Wave 1, 2 & 3* | <i>wt_w1_w2_w3</i> | X | X |
| Wave 1 & 3* | <i>wt_w1_w3</i> | X | |
| Wave 2 & 3* | <i>wt_w2_w3</i> | X | |

*Interviewed in every visit

4.0 Training of Field Staff and Data Entry Operators for the Survey

4.1 Training Design

Two levels of training were mounted for both the post-planting survey and the post-harvest survey. The first level was organized at NBS Headquarters in Abuja and was called the Training of Trainers (TOT). The participants in the TOT became the resource persons for the next level of training. The top management staff of the survey team participated in the TOT, which lasted for five days. The core training materials for the 2nd level training were harmonized and finalized during the TOT. The persons trained in the TOT were then sent to carry out the second level training.

The second level training was conducted over a nine-day period. Seven days were dedicated to theory including data entry training and two days to field practice and review. Participants in the training were Zonal Controllers, State Officers, Field Supervisors, Field Interviewers, and Data Entry Operators. Training instructions were given to the field staff by the resource persons from the management team (NBS, FMS&RD, and NFRA) with support from World Bank technical missions. Three (3) resource persons were sent to each training centre to perform the training.

Specifically, the training consisted of (i) classroom instructions on the questionnaire, concepts and definitions, (ii) interview techniques, (iii) methods and field practices in performing actual interviews to ensure that field interviewers fully understood the questionnaire and (iv) data entry and data management. In addition, participants did actual interviews in the field with households that were not scheduled to be part of the actual survey sample. Most of the training instructions are detailed in the interviewer's and supervisor's manuals which are also available.

4.2 Training Locations

Due to security concerns in the North-East and North-West zones, the training for those two zones was moved to North-Central zone. As a result, the North-East and North-West were trained in two training locations near the town of Karu in Nasarawa State. The training for the South-East, and South-South zones was conducted in Enugu (Enugu State). The training for the South-West and North-Central zones was conducted in Ibadan (Oyo State).

4.4 Evaluation of Field and Data Entry Staff

At the end of the training session, trainees were assessed according to both a test that was administered on the material covered in the training process, and an evaluation by the resource persons. Based on the results of the tests some interviewers and data entry operators were removed from the survey. In some instances, the removed workers were replaced and in other cases there was no replacement but those remaining in the team were given extra time to complete the fieldwork and data entry.

5.0 Field Work

5.1 Organization of Fieldwork

Data were collected by teams consisting of a supervisor, between 2 and 4 interviewers, and a data entry operator. The number of teams varied from state to state depending on the sample size or number of EAs selected. The teams moved in a roving manner and data collection lasted for between 20 – 30 days for each of the post-planting and post-harvest visits. Additional details on the structure of the visits are available in Section 7.

The GHS-Panel Wave 3 was administered in two visits: post-planting (September - November 2015) and post-harvest (February - April 2016). A tracking phase was conducted after both visits in October-November 2015 and April-May 2016 to interview households that had moved from their location in the previous visit (Wave 1 or Wave 2) or had moved between Visit 1 and Visit 2 in Wave 3.

5.2 Gift to Households

As a show of appreciation for the panel households continued participation, all panel households that were located, were given a gift (even if they refused to participate). These gifts were given during the post-planting survey and consisted of either a torchlight or a rechargeable lamp. Households were very appreciative of the gifts and in many cases were essential to ensure continued participation of the household in the panel.

5.3 Pre-printed Information

To facilitate identification of the same people over time, the field team implemented Wave 3 with a pre-printed household roster. The roster asks for information on all members interviewed in Wave 1 or Wave 2 (no matter whether they still reside in the household, have moved or are deceased). New members are added to the roster. So the ID number in the roster can be merged with Wave 1 and Wave 2 to identify the same respondent.

Interviewers were also provided with prefilled forms in the second (post-harvest) visit that contained information from the first visit. This included: (1) an updated household roster, (2) plot roster, and (3) plot-crop roster. During the post-harvest visit, interviewers were also provided with a prefilled form containing the list of nonfarm enterprises collected in Wave 1 and Wave 2. This was done to more effectively maintain a panel of nonfarm enterprises.

5.4 Fieldwork Monitoring and Evaluation

As an additional aid to ensuring good quality data, extensive monitoring was done of the field work. There were three levels of monitoring and evaluation. The first level of monitoring followed immediately after the zonal training. One (1) monitor was assigned to 2 states and all states were covered, including Federal Capital Authority, Abuja (FCT, Abuja). This monitoring was carried out by the technical team from the zonal training (i.e. the trainers) which included

individuals from the Head Office of NBS. The first monitoring team also included World Bank officials and consultants. The second monitoring was carried out by NBS state officers and zonal controllers and took place over an extended period during the fieldwork. The third and final monitoring took place no later than a week before the end of fieldwork. The team involved in the third monitoring was selected from the team that carried out the first monitoring.

During first and second monitoring, the monitors made sure that proper compliance with the procedures as contained in the manual were followed, effected necessary corrections and tackled problems that arose. The third monitoring focused on data issues and included checking the entered data against data in the questionnaires. Where problems were found, these were corrected either directly or through a revisit to the household for verification of information or for further information.

5.5 Methodological Experiment

In the post-harvest visit, a methodological experiment was implemented. For this experiment, two versions of the household questionnaire were administered. The only difference between these two versions is the placement of the *Behavior* and *Attitude* sections (*Section 6A* and *6B*). In version 1 these sections were asked in the middle of the questionnaire (following *Section 6: Remittances*). In version 2, these two sections were asked at the end of the questionnaire (following *Section 15C: Conflicts*). Households *within each EA* were randomly assigned to receive one of the two versions. If an EA had 10 households, 5 were randomly assigned version 1 and 5 assigned version 2. The questionnaire provided in the documentation is for Version 1, but the Version 2 questionnaire is available on request. However, the content collected in both versions is exactly the same. In the data sets, both versions of the *Behavior* and *Attitude* sections have been combined into single files (*sect6a_harvestw3.dta* and *sect6b_harvestw3.dta*). The different version of the questionnaire administered is indicated in both files by the variable *version*.

6.0 Household Tracking Exercise

There were two separate tracking exercises conducted in Wave 3. The first was conducted directly following the post-planting visit and the second following the post-harvest visit. During the post-planting tracking exercise, households that moved since the last time they were interviewed (either Wave 1 or Wave 2) and the first visit of Wave 3 were tracked. During the post-harvest tracking exercise, households that moved between the post-planting and post-harvest visits of Wave 3 were tracked. During the main interview period of the post-harvest and post-planting visits, interviewers were instructed to complete a tracking form for all households who had relocated. In the case of households that moved to nearby locations, i.e. within the enumeration area, the interviewers were instructed to locate these households and administer the questionnaires.

6.1 Tracking States and Staff Assignments

Both tracking exercises were conducted by staff of the panel management team with support from interviewers in each of the states. In states with two or less households to be tracked, the tracking was conducted by state staff only. Tables 6.1 and 6.2 below show the states where the tracking exercises took place, the number of households to be tracked and the number of field staff that were engaged in the activity.

Table 6.1: Number of Households to be Tracked and Allocation of Field Staff
POST PLANTING TRACKING

| STATE WHERE HOUSEHOLD RELOCATED | NUMBER OF HOUSEHOLDS | VISITED BY HQ STAFF | Number HQ Persons | Number State Persons |

6.2 Training of Tracking Staff

Training for both tracking exercises was conducted at the NBS head office for panel staff that would be involved in the tracking activity. The post-planting tracking training took place on October 7, 2015 while that of the post-harvest was conducted April 20, 2016. The headquarters persons trained were to train their partner staff as well as state officers in their assigned state. A number of trainers also had the responsibility of training staff from states where no headquarters staff were slated to visit. The tracking fieldwork for the post-planting occurred from October 12, 2015 to November 6, 2015, while the post-harvest tracking was fielded over the period April 25, 2016 to May 6, 2016.

6.3 Tracking Methodology

The tracking of households included the following steps:

- Discussion of the set of tracking households with relevant GHS-Panel interview team to obtain all information necessary. Use this information to finalise the list of households that will be tracked
- In order to properly prepare for the tracking field activities, the tracking exercise was initiated by the panel management team while at NBS head office. Contact was made with most of the households to be tracked by using the phone numbers given on the tracking forms. Information was also used from the contact information on the questionnaires. That is, where households could not be contacted using the information on the tracking form, the contact information for family, friends and neighbours which was collected in the household questionnaire were also used. These preliminary tracking activities proved to be a very useful exercise in confirming the location of the relocated household and laying out the plan for the tracking fieldwork. Also, the opportunity was taken during the preliminary exercise, to obtain directions to households' new address and to set appointments for the interview.
- In cases where there was no useful phone information (either on the tracking form or household contact information) and the new address of the household was not known, the original location of the household was visited and effort made to obtain phone numbers for the household or the address. When information on the address was obtained, the household was visited by the team in charge of the state to which the household had moved.
- The required questionnaires were then administered to the household by the tracking team upon locating the household and securing their cooperation.

6.3.1 Tracking Households with Unknown Locations

Households with an unknown new address have been included as a part of the state in which they were originally located. It was the responsibility of the head office staff going to the original state of these "unknown" households to make an effort to gather further information on the place to which the household had relocated. This effort was made early in the head office staff member's visit to the state. In cases where the household had moved to a new state, the new household

location was passed to the staff member visiting the state to which the household had relocated. This household then became a part of that staff member's tracking assignment. If the household had moved to another location within the original state, then it was included as a tracking assignment of the head office staff member in that state.

6.4 Identifying Tracked Households in the Data

Tracked households are identified by the *tracked_obs* variable that is included in the cover sheet data set. For households interviewed during the post-planting tracking exercise, see *tracked_obs* in the data file *secta_plantingw3* found in the Post-Planting Household data folder. For household interviewed during the post-harvest tracking exercise, see *tracked_obs* in the data file *secta_harvestw3* found in the Post-Harvest Household data folder.

7.0 Data Management and Description of Datasets

7.1 Data Management

7.1.1 Data Entry

The household and agricultural components of the survey were conducted using concurrent data entry approach. In this method, the fieldwork and data entry were handled by each team assigned to the state. Each team consisted of a field supervisor, 2-4 interviewers and a data entry operator. Immediately after the data were collected in the field by the interviewers and supervisors (the supervisors administered the community questionnaires and collected data on prices), the questionnaires were handed over to the supervisor to be checked and documented. At the end of each day of fieldwork, the questionnaires were then passed to the data entry operator for entry. After the questionnaires were entered, the data entry operator generated an error report which reported issues including out of range values and inconsistencies in the data. The supervisor then checked the report, determined what should be corrected, and decided if the field team needed to revisit the household to obtain additional information. The benefits of this method are that it allows one to:

- ◆ Capture errors that might have been overlooked by a visual inspection only,
- ◆ Identify errors early during the field work so that if any correction required a revisit to the household, it could be done while the team was still in the EA

The CSPro software was used to design the specialized data entry program that was used for the data entry of the questionnaires.

7.1.2 CAPI

For the first time in Wave 3, a portion of the survey was collected using Computer Assisted Person Interview (CAPI) techniques. The community questionnaire was implemented in both the post-planting and post-harvest visits of Wave 3 using the CAPI software Survey Solutions. The Survey Solutions software was developed and maintained by the Survey Unit within the Development Economics Data Group (DECDG) at the World Bank. Supervisors were given tablets which they used to conduct the community questionnaire interviews. The primary purpose of this limited CAPI implementation was to test the viability of Survey Solutions for use in future surveys implemented by NBS, including succeeding waves of the GHS-Panel. Overall, implementation of Survey Solutions for the community module in Wave 3 was highly successful.

7.1.3 Data Communication System

The data communication system used in Wave 3 was highly automated. Each data entry person was given a mobile modem and once they connected to the internet the system would automatically send entered data to the head office in Abuja. The data entry persons were instructed to do this every one or two days so there was a steady flow of current data from the field to the head office.

7.1.4 Double Data Entry

For the first time in Wave 3, double data entry was performed for all household and agriculture questionnaires in both the post-harvest and post-planting visits. Double data entry was implemented to identify and correct data entry errors. The first data entry (FDE) was performed in the field by data entry operators assigned to each survey team. Following completion of fieldwork, all questionnaires were shipped from the State offices to NBS headquarters in Abuja. A team of data entry operators was selected to perform the second data entry (SDE) at NBS headquarters. The SDE team consisted of a mix of data entry operators that participated in the field entry and some that did not. This team entered all household and agriculture questionnaires. When re-entering these questionnaires, any differences with the first data entry are flagged by CSPro and prompt the data entry operator to confirm what they have entered is correct. This design was intended to limit any data entry errors from FDE.

7.1.5 Data Cleaning

The data cleaning process was done in three main stages. The first stage was to ensure proper quality control during the fieldwork. This was achieved in part by using the concurrent data entry system which was, as explained above, designed to highlight many of the errors that occurred during the fieldwork. The data was reviewed by the panel management team for inconsistencies and extreme values. Special care was taken to see that the households included in the data matched with the selected sample and where there were differences these were properly assessed and documented. The agriculture data were also checked to ensure that the plots identified in the main sections merged with the plot information identified in the other sections. Identified errors were compiled into error reports that were regularly sent to the teams. These errors were then corrected based on re-visits to the household on the instruction of the supervisor. The data that had gone through this first stage of cleaning was then sent from the state to the head office of NBS where the data was reviewed again.

The second and third stages of cleaning involved a final comprehensive review of the data primarily conducted by World Bank staff in Washington, DC in consultation with the headquarters and state offices of NBS in Nigeria. The second stage of cleaning consisted of a review of the FDE and SDE data. In general, the SDE was taken to be the version of the data the most closely corresponded to what was entered in the paper questionnaire. However, there was a review of some differences between the two entries where the SDE was inconsistent, out of range, or missing while the FDE was not. In these cases, FDE was used for the final raw data set that was used for the third stage of cleaning.

The third stage of cleaning involved a comprehensive review of the data coming out of the second stage. Every variable was examined individually for (1) consistency with other sections and variables, (2) out of range responses, and (3) outliers. Quite often when consistency errors were identified, the two versions of data entry were compared and switched if one of the errors was not present in one version. In cases where the error was present in both FDE and SDE, questionnaires were checked when deemed necessary and corrections made. However, special care was taken to avoid making strong assumptions when resolving potential errors. Some minor errors remain in the data where the diagnosis and/or solution were unclear to the data cleaning team.

7.2 Description of Datasets

The GHS-Panel Wave 3 was administered in two visits: post-planting (September - November 2015) and post-harvest (February - April 2016). During each visit two questionnaires were administered to the household respondents (Household Questionnaire and Agricultural Questionnaire) and a third questionnaire was administered at the level of the enumeration area (Community Questionnaire). The tracking phases were completed in October 2015 (post-planting) and April/May 2016 (post-harvest). The tracking data is integrated into the post-planting and post-harvest structure, even though the data were actually collected in the tracking phase. The questionnaires implemented for tracking households were identical to those used in the main interview phase.

7.2.1 Post Harvest Only Households

In Wave 3, there were 20 households that were only visited in the post-harvest visit. Nineteen of the households were located in two EAs that could not be visited in the post-planting period due to security concerns. The remaining household was in an EA that was visited, but the household could not be located in the post-planting visit (including during the tracking phase), but was located in the post-harvest. For these 20 households, the full post-harvest questionnaire was implemented. In addition, the portion of the post-planting questionnaire that is not repeated in post-harvest (e.g. household roster, food consumption, nonfood expenditure, food security, etc.) was also administered. For these non-repeated sections, there will be no data present in the post-planting version of the data. These households are identified in both of the cover sheet data sets (*secta_plantingw3* and *secta_harvestw3*) by the variable *phonly_obs*.

7.2.2 Household Data

In the Household Questionnaire, some of the modules were administered in both the post planting and post-harvest visit and others were only administered during one of the two visits. This should be taken into account when using the datasets.

Group 1: These modules are administered in both visits. For these topics we have complete information at two points in time during the year of the survey.

- Roster
- Labour
- Meals Away from Home
- Food Consumption and Expenditure
- Nonfood Expenditure
- Food Security
- Other Household Income
- Contact Information

Group 2: These modules only appear in either the post-planting or the post-harvest visit

- Post-planting only
 - Savings and Insurance

- ICT – Mobile Phone Banking
- Credit
- Household Assets
- Subjective Wellbeing
- Housing
- Post-harvest only
 - Education
 - Health
 - Child Development
 - Remittances
 - Behaviour
 - Attitude
 - Nonfarm Enterprise and Income Generating Activities
 - Aggregate Food Consumption
 - Other Household Income
 - Safety Nets
 - Economic Shocks
 - Deaths
 - Conflict

Tables 7.1a and 7.1b show the sections of the Household Questionnaire and the datasets that correspond to these.

Table 7.1a: Post-planting household datasets

7.2.3 Agriculture Data

It should be noted that in the Agriculture Questionnaire, the plot roster and land inventory information collected during the post-planting visit is updated during the post-harvest visit in the Land section to include additional plots households may have acquired or old plots they have disposed of since the first, post-planting visit.³ The crop codes used in the Agriculture Questionnaire are presented in Appendix 3. As with the Household Questionnaire, some modules were administered in both visits. For these modules, during the post-harvest visit, information was gathered on the activities since the post-planting interview.

³ In theory, some plots in Wave 3 can be matched to Wave 1 and 2 using the characteristics of the plots. However, the plot description and codes were not prefilled from previous waves. Thus plots cannot be matched across plots using plot IDs.

7.2.5 Confidential information

Note that, for purposes of maintaining the confidentiality of the data, all names and addresses have been removed from the datasets. Additionally, the GPS coordinates have also been removed as these could be used to locate households and plots with accuracy. See Appendix 4 and the next section on the geo-variables which are made available in lieu of actual locations of household dwellings and plots.

7.2.6 Geospatial variables

To increase the use of the GHS-Panel data, a set of geospatial variables has been provided by using the georeferenced plot and household locations in conjunction with various geospatial databases that were available to the survey team. More information is available in Appendix 4 on how these variables are constructed and linked to the GHS-Panel data. The table in Appendix 4

provides the name, type, source, reference period, resolution, description, and source of each geospatial variable included.

7.2.5 Status of household and individuals

Two additional data sets are released with Wave 3 which summarize the status of households and individuals across all six visits of the three waves: ***HHTrack.dta*** and ***PTrack.dta***. The HHTrack data set also contains the full set of survey weights (see Section 3.0 for details on the weights).

7.2.7 Non-Standard Units Conversion Factors

Food and crop quantities are often reported in non-standard units in the data. In order to convert from non-standard units to the more widely understood standard units (kilograms and litres), two sets of conversion factor files are included with the data. The first is ***food_conv_w3.dta*** which contains the conversion factors for food quantities in the food consumption file. The second is the dataset ***ag_conv_w3.dta*** which contains conversion factors for crops to be used with the agricultural module. For more information on these files and how to use them, see Section 8.4.1.

8.0 Using the Data

8.1 File Structure

The data should always be used in conjunction with the questionnaire and the interviewer's instruction manual. Where there are no issues of confidentiality all the variables from the questionnaire have been included in the data sets. In some cases, there is an additional variable which contains the "other specify" information that was written in the questionnaire. So, for example, if there is a variable with two parts question 5a and question 5b, a third variable, question 5c, might be added which would contain the other "specify information". In some cases, the other specify variable will be indicated with an "_os" attached to the variable name.

Every effort was made to keep question numbers (and thus variable names) as consistent as possible with wave 2. If questions were dropped in Wave 3, the numbering was preserved. If questions were added in the middle of a section, a letter was added to the question number at that space in the sequence (e.g. if added before question 2, the question number would be 2a). This was done to make utilization of the data sets across the three waves as consistent as possible.

8.2 Merging Datasets

8.2.1 Household and Agriculture Datasets

All household and agriculture datasets in both the post-planting and post-harvest files contain a variable (***hhid***), which is a unique identifier for the household. This variable is used as the unique key variable in the merging of all household type datasets. In some of the other types of datasets, additional key variables may be required in the merging process. In the case of individual type files, the variable that uniquely identifies the individual in the household is ***indiv***. So in order to merge any two individual type files, both the variables ***hhid*** and ***indiv*** would be used. In the agriculture datasets, plot files are merged using ***hhid*** and ***plotid*** while crop files are merged using ***hhid***, ***plotid*** and ***cropid***.

8.2.2 Post-Planting and Post-Harvest Datasets

Post-planting and post-harvest files can be merged using the methodology explained above. That is, the ***hhid*** is the same for a specific household in the post-planting and post-harvest visit. It should be noted that there was some attrition of households between the post-planting and post-harvest visits so some households in the post-planting files will not have a match in the post-harvest data sets. Note also that people may have left the households or joined them in the time between the two visits. Thus the number of people per household will vary between visits.

8.2.3 Community Datasets

The community questionnaire is administered at the EA level so the location variables ***lga*** for local government area (LGA) and ***ea*** are unique for each community questionnaire. Merging of community files within the round or with community files from the other round or with any of

the household or agriculture files from either round should be done using the *lga* and *ea variables*, in that order.

Location variables: *zone*, *state*, *lga*, *sector*, *ea* and *ric* have not been included in all the datasets. Instead, these variables have been included in the questionnaire cover datasets, i.e. *secta_harvestw2*, *secta_plantingw2*, *sectc_harvestw2* etc., and from there they can be merged into any of the other datasets using the key variables as explained above.

8.3 Network Roster

A network roster is included in both the post-planting and post-harvest agriculture questionnaires. The network roster keeps a record of the list of places (businesses, markets, persons etc.) with which the household engages in agricultural trading activities. Each place is assigned the network code of the line in which it is in that section. Each place is recorded only once so we have for example, network codes N1, N2 etc. which is just a serialization of the places. This is similar to the household roster where an individual acquires the individual code of the line in which the person's name is written.

After the information has been entered in the network roster, the network code can be used in any section of the Agriculture Questionnaire where a place of trading is requested. The network roster contains information on the type of place and its location.

8.4 Food and Crop Unit Measures

When collecting information on food or crop quantities (e.g. amount of food consumed, amount of crop harvested, etc.), respondents were allowed to report in any unit that they were most familiar with. Quite often, respondents provided quantities in non-standard units like “milk cup”, “mudu”, or “sack” (as opposed to standard units like kilograms, litres, etc.). In wave 3, the unit list was expanded to account for a wider range of possible units that are common in Nigeria. In addition, for some units, respondents were required to provide a size (small, medium, or large) for the unit. This element was added to better account for variations in the size of some units. In order to standardize the relative sizes of units, interviewers would show the respondent a photo of the unit including the difference sizes as applicable. The respondent would then indicate the appropriate size for the unit they are reporting in. This was particularly important for vaguely defined units such as “piece” or “heap” which are relatively common. For these units, item-specific photos were shown to the respondent.

8.4.1 Unit Conversion Factors

The expanded list of units used in Wave 3 required additional conversion factors not previously available to convert these non-standard units into a common standard unit (kilograms or litres). In order to collect the item-unit weights required to calculate conversion factors, a specialized market survey was implemented prior to commencement of Wave 3. Reference photographs were also taken for all item-unit weights collected. The market survey was conducted in all 6 geopolitical Zones (2 States in each Zone) in an effort to capture variations in conversion factors throughout the country.

A wide array of item-unit weights was collected in this survey and were then used to calculate conversion factors. The calculated conversion factors are contained in *food_conv_w3.dta* and *ag_conv_w3.dta* included in the Wave 3 data. In both files, there are separate variables which have zone-specific conversion factors (e.g. *conv_NC_1*). There is also a national conversion factor (*conv_national*). Where conversion factors were acquired for a particular zone, the average conversion was included for the zone. However, if there was no conversion found in a zone, the national average was used for the zone-specific conversion variables. Although these conversion factors cover a majority of item/crop-unit combinations observed in the data set, there are still some gaps where conversion factors are not available. There is an ongoing effort to fill these gaps and updated conversion factors will be released as they become available.

In order to use the conversion factors, one has to multiply a crop or food item with a conversion factor. For example, the dataset *sect7b_plantingw3.dta* features question 2, which asks how much the household consumed of each food item. One household is said to have consumed 1.5 large heaps of onions. In order to convert “large heap” to kg, the dataset *food_conv_w3.dta* has to be merged on the item code and unit code⁴, and then the quantity (1.5 in this example) is multiplied with the relevant conversion factor. This could either be the conversion factor for that household’s particular zone (variable *conv_SE_4* for South East) or the national conversion factor (variable *conv_national*). It is highly recommended that the zone specific conversion factors are used. The same procedure can be followed to convert crop quantities using *ag_conv_w3.dta*.

These conversion factors are specific for the format of the Wave 3 data. It is possible to use them with previous waves of the data, but it requires making some assumptions. For example, there are no different sizes captured in the previous waves, so the sizes contained in the Wave 3 conversion factors must be collapsed or reduced to a single size for any kind of use with the previous waves. However, revised food conversion factors are being prepared that can be used with Wave 2 and Wave 1 consumption information. Once available, these will also be released for public use.

8.4.2 Reference Photo Album

Although reference photographs were used in Waves 1 and 2 of the GHS-Panel, in Wave 3 the collection of photos was greatly expanded and improved. The photos were collected in a systematic manner during the market survey where the item-unit weights were also collected. During the market survey, interviewers were instructed to follow strict protocols when taking the photographs such as including a reference object (typically a standard sized bottle of water) to provide the respondent with a frame of reference for the size of the unit. For units with multiple sizes, all of the relevant sizes were taken in the same photo for easier comparison by the respondent. The reference photos taken during the market survey were compiled into an album that was printed and provided to all interviewers. Item-specific photos were included for noncontainer units (piece, heap, bunch, stalk) while only one photo of containers (e.g. milk cup, tiya, mudu) were included. The reference photo album that was used by interviewers is included with the additional documentation on the website (see “Photo Aids”) The procedures used for collection of the reference photos as well as the conversion factors followed the guidelines laid

⁴ With updated food conversion factors from November 2018, the user can now merge on *item_cd*, *unit_cd*, and *unit_other* to accommodate “other” units.

out in a forthcoming guidebook produced by the LSMS team, *The Use of Non-Standard Units for the Collection of Food Quantity: A Guidebook for Improving the Measurement of Food Consumption and Agricultural Production in Living Standards Surveys*.

9.0 Overall Problems and Challenges Faced During Wave 3

Designing and implementing a complex survey such as the GHS-Panel presents various challenges. In this section we outline some key issues that arose, lessons learned and make recommendations for the next Wave of the survey.

9.1 Tracking

One challenge was the way in which the interviewers completed the tracking forms. In some instances, the tracking form was not properly completed and this resulted in significant difficulty, and even failure, in tracking the relocated households. During the post-harvest training, a greater emphasis was placed on properly filling out these forms. As a result, filling of the tracking forms was improved in the post-harvest visit, making the tracking exercise easier to implement. In future Waves, the importance of filling tracking forms completely should be emphasized in the training.

9.2 GPS Measurement of Plots

During the post-planting visit, there were some challenges with measurement of plots using GPS devices. Only about 80 percent of plots were measured. Non-measurement was concentrated in several States. In some cases, this was the result of flooding (especially in South East), but in other cases the interviewers were reluctant to measure plots that were distant from the household (though still within the Local Government Area). During the post-harvest visit, interviewers were asked to measure plots that were not measured in the post-planting visit. Additional questions were added in the post-harvest agricultural questionnaire (*Section A1: Land*) and the measurement status of each plot was included in the plot roster prefiling form.

The majority of these plots were measured in the post-harvest visit. This increased the number of GPS measured plots to about 92 percent. Some plots could still not be measured due to flooding or security concerns in some areas. In future waves, the rate of GPS measurement by each team must be more closely monitored in the post-planting visit to ensure that plots are consistently being measured.

9.3 Availability of Electricity

Electricity was required by the data entry operator to operate the laptop computer and printer when in the field. This problem was anticipated so provision was made for use of generators in the State offices and while in the field. This strategy was partially successful, but there still some challenges encountered. In some cases, when teams were far from the State office it was difficult to locate a generator to use. As a result, the data entry operator had to return to the State office to recharge and continue entering questionnaires before re-joining the team in the field.

9.4 Security Problems

The most significant challenge faced during Wave 3 was the security situation in the North East of the country, particularly Borno and Yobe states. In both states, there were several areas that

were impassable due to road blocks by security forces or were deemed too hazardous for field staff to visit. A total of 14 EAs (12 in Borno State and 2 in Yobe State) comprising 137 households could not be visited and thus no households were interviewed in these EAs. Security concerns were present in other localities within and outside of the North East. Sometimes, the teams had to adjust their plans based on the situation on the ground.

9.5 Data Entry

Data entry has been a significant source of errors in previous waves of the panel survey. Following the recommendation from Wave 2, in Wave 3 a double data entry system was implemented. All household and agriculture questionnaires were entered twice: once in the field and again at NBS headquarters. This design was meant to correct any data entry errors from the first data entry ensure that the data entered exactly matches what was written in the questionnaire and therefore. However, there were some challenges encountered in this process. The most significant challenge was that some interviewer errors identified while in the field were corrected in the data entry system, but not effected on the questionnaire. These errors were therefore still present when entered during SDE. This required a more deliberate review of both FDE and SDE data during the cleaning process (see the next section).

If a double data entry system is used in the future, it must be further emphasized to interviewers that all correction made in the data entry system should also be effected in the questionnaire. In the end, what is entered in the data entry system should correspond exactly with the questionnaire.

Appendix 1: How to Obtain Copies of the Data

The data are available through the NBS web site:

<http://www.nigerianstat.gov.ng/>

or through the LSMS-ISA website:

<http://www.worldbank.org/lsms-isa>

Users do not need to obtain the permission of the NBS to receive a copy of the data, but will be asked to fill in a data access agreement. In this agreement, users agree to: (a) cite the National Bureau of Statistics as the collector of the data in all reports, publications and presentations; (b) provide copies of all reports publications and presentation to the National Bureau of Statistics (see address below) and the Poverty and Inequality Division of the World Bank (see address below); and (c) not pass the data to any third parties for any reasons.

Appendix 2: Agriculture Land Conversion Factors

The table below shows the conversion factors used to convert self-reported land areas (for agricultural land area of crops planted and harvested) into hectares.

General Conversion Factors to Hectares

| Zone | Unit | Conversion Factor |
|------|-----------|-------------------|
| All | Plots | 0.0667 |
| All | Acres | 0.4 |
| All | Hectares | 1 |
| All | Sq Meters | 0.0001 |

Zone Specific Conversion Factors to Hectares

| Zone | Conversion Factor | | |
|------|-------------------|---------|---------|
| | Heaps | Ridges | Stands |
| 1 | 0.00012 | 0.0027 | 0.00006 |
| 2 | 0.00016 | 0.004 | 0.00016 |
| 3 | 0.00011 | 0.00494 | 0.00004 |

Appendix 4: Confidential Information, Geospatial Variables⁵

The GHS-Panel collects confidential information on respondents. The confidential variables pertain to (i) names of the respondents to the household and community questionnaires, (ii) village and constituency names, (iii) descriptions of household dwelling and agricultural plot locations, (iv) phone numbers of household members and their reference contacts, (v) GPS-based household and agricultural plot locations, (vi) names of the children of the head/spouse living elsewhere, (vii) names of the deceased household members, (viii) names of individuals listed in the network roster, and (ix) names of field staff. To maintain the confidentiality of our respondents, certain parts of the GHS-Panel database have not been made publicly available.

To enhance the GHS-Panel data, a set of geospatial variables has been generated using the georeferenced plot and household locations in conjunction with various geospatial databases that were available to the survey team. These include simple measures of distance, climatology, soil and terrain and other environmental factors. The variables are intended to provide some understanding of how geophysical characteristics vary across households and between communities.

All geospatial variables have been produced using the unmodified GPS data. Most of the underlying datasets are static (with exception of time-series), so the values should be largely unchanged relative to year 1, for non-mover households. Note that there may be some variation due to GPS data entry error, differences in data collection procedure, and technical limitations of the device. Geospatial variables are provided in 2 separate files: *NGA_PlotGeovariables_Y3* and *NGA_HouseholdGeovariables_Y3*.

NGA_PlotGeovariables_Y3

The household plot-level file, *NGA_PlotGeovariables_Y3*, contains four variables measuring plot distance to household, slope of plot, elevation of plot and plot potential wetness index. The observations are uniquely identified by the combination of **hhid** **plotid**. The observations included in this file are plots that are owned and/or cultivated by the household and that have been visited for GPS-based land area measurement.

Coordinates of the plots are not included.

NGA_HouseholdGeovariables_Y3

The household-level file, *NGA_HouseholdGeovariables_Y3*, contains a range of variables measuring (on the basis of the household dwelling) distance to other features, climatology, landscape typology, soil and terrain, and growing season parameters. The observations are uniquely identified by **hhid**.

⁵ Users have occasionally requested actual geographic locations of households in the sample from the LSMS Office. The World Bank is not authorized to release these data. All requests for actual geographic locations must be made to NBS.

This file also contains modified GPS coordinates, which enables users to generate their own spatial variables while preserving the confidentiality of sample household and communities. Following the method developed for the Measure DHS program, the coordinate modification strategy relies on random offset of cluster center-point coordinates (or average of household GPS locations by EA in GHS-Panel) within a specified range determined by an urban/rural classification. For urban areas a range of 0-2 km is used. In rural areas, where communities are more dispersed and risk of disclosure may be higher, a range of 0-5 km offset is used. An additional 0-10 km offset for 1% of rural clusters effectively increases the known range for all rural points to 10 km while introducing only a small amount of noise. Offset points are constrained at the state level, so that they still fall within the correct state for spatial joins, although boundary precision may be an issue for clusters located very close to the border.

In the third wave of panel data collection some households are tracked to a new location. These include both local and long-distance moves, although a majority of tracked households are within 5 km of the original location. The public coordinates for new locations that are within 5 km of the original household location remain unchanged (modified coordinates of original sample EA). The public coordinates of tracked households that are more than 5 km from original location are assigned a new offset location, according to the method described above. Additionally, the distance from original location is provided for tracked households with new locations.

The result is a set of coordinates, representative at the cluster level, that fall within known limits of accuracy. Users should take into account the offset range when considering different types of spatial analysis. Analysis of the spatial relationships between locations in close proximity would not be reliable. However, spatial queries using medium or low resolution datasets should be minimally affected by the offsets. Zonal statistics (average or range of values within an area corresponding to the known range) could help minimize the effect of offsets when combining with large scale data or high resolution grids with a high degree of local variation.

The tables below provide the name, type, source, reference period, resolution, and description of each variable. With the exception of 3 distance variables (dist_road2, dist_popcenter2, dist_borderpost2), the source data are unchanged. The three distance variables have been updated using more reliable spatial datasets.

Appendix 5: Sampling Details

Final Weighting Procedures for Nigeria Panel Survey by Wave and Visit

1. Background

The National Bureau of Statistics (NBS) of Nigeria has been conducting the General Household Survey (GHS) annually in recent years to measure various socioeconomic indicators at the state level. The Nigeria Panel Survey is a longitudinal survey based on a subsample of the primary sampling units (PSUs) and households selected for the GHS. The integration of the longitudinal Panel Survey with the GHS makes it possible to conduct a more comprehensive analysis of poverty indicators and other socioeconomic characteristics, and improve the precision of estimates of trends in the indicators over time.

The Panel Survey is conducted every 2 to 3 years as a longitudinal survey, with two visits in each wave, scheduled based on agricultural seasons in order to obtain information on the crop production during the second visit. When a sample household moves the survey includes procedures to track the household in order to collect the data from that household at its new location. However, in the case of split households where only some of the household members move, no tracking is conducted.

The first (baseline) Panel Survey was conducted in the second half of 2010, referred to as Wave 1, Visit 1. For the current analysis of the Panel Survey data there are datasets available for each of two visits from the first three waves. Although some tables will be produced for the data from each individual visit, the data from different visits will also be matched to obtain files with the combined data for each wave, as well as a combined data file for all visits of the different waves. Since the response rate is different for each visit, the combined data files are limited to the households with completed interviews for all visits. For this reason, it is necessary to calculate different weights for each visit, and for the data from each combination of visits.

The purpose of this report is to describe the weighting methodology for the Nigeria Panel Survey, including all the procedures involved in calculating the weights for each wave and visit, as well as for the combined datasets. Since the weights are based on the sample design, the next section provides a brief description of the sample design for the GHS and the Panel Survey. The panel of sample households is established during the baseline survey, so the basic weights are determined based on the sampling frame for that survey. The weights for other visits and combined datasets are then adjusted based on the interview results for the individual visits.

This report was updated for Wave 3 of the Panel Survey to document the calculation of the weights for that round and for the matched panels from previous rounds. In Wave 3 a conflict module was added to the Panel Survey. The sample EAs in the Panel Survey that are located in areas classified as conflict areas were identified, and a supplemental sample of 5 households was selected in each of these EAs, after a new listing was conducted. The purpose of this expanded sample was to increase the number of sample households in the conflict areas in order to improve the precision of indicators related to the effects of the conflicts. The weighting procedures for this

full sample including the additional households in the conflict areas are also described in this report.

2. Summary of Sample Design for the 2010 GHS and Panel Survey

A comprehensive description of the sample design for the 2010 GHS and the Panel Survey can be found in the report on "Final Sample Design and Estimation Procedures for 2010 Nigeria General Household Panel Survey" (Megill, July 2010). A summary of the sample design is presented here in this section. Since the Panel Survey is based on a subsample of the 2010 GHS sample primary sampling units (PSUs) and households, the sample design for the GHS is described first.

A multi-stage stratified sample design was used for the GHS and the Panel Survey. These and other national household surveys conducted by the NBS are based on a master sample referred to as the National Integrated Survey of Households (NISH). The sampling frame for the NISH was based on the list of enumeration areas (EAs) defined for the 2006 Nigeria Census of Population. The EAs are operational segments defined for the census enumeration, with an average of about 34 households each. The EAs are identified on maps with well-defined boundaries. The EAs are used as the primary sampling units (PSUs) selected at the first sampling stage for the national household surveys. The institutional population living in prisons, hospitals, military barracks, school dormitories, etc. are excluded from the universe defined for the household surveys. The average number of households per EA is about 37 for the urban areas and 33 for the rural areas, and the variability in size is somewhat higher for the urban EAs.

The NBS has classified the EAs in the NISH master sample by urban and rural sectors, based on characteristics of the infrastructure. However, this information was not used for stratifying the master sample, since it is not considered official. The urban and rural sectors are used as domains of estimation for most national household surveys in Nigeria, although in the past some surveys have not always used a consistent definition of the urban and rural classification.

First the NBS selected a master sample of EAs in each Local Government Area (LGA) that could be used for any LGA-level survey. For this LGA master sample 30 EAs were selected with equal probability within each LGA for the 36 states, and 40 EAs were selected in each LGA for Abuja FCT. There are 769 LGAs in the 36 states of Nigeria and 6 LGAs in Abuja, so a total of 23,310 EAs were selected for the LGA master sample. The 30 EAs selected for the master sample in each LGA were divided into 10 systematic replicates, identified in the frame by the replicate identification code (RIC).

The individual states of Nigeria are the geographic domains of analysis for most of the national household surveys such as the GHS. Therefore, the NBS has selected the NISH sample EAs as a state-level subsample of the LGA master sample EAs, consisting of 200 sample EAs for each state. In order to select the NISH subsample of EAs in each state, the 30 master sample EAs in each LGA for that state were pooled together. The total number of EAs in the LGA master sample for each state is equal to 30 times the number of LGAs in the state. Then a systematic sample of 200 sample EAs was selected with equal probability at this second stage across all LGAs within the state. The NISH sample EAs in each state were divided into 20 replicates of 10 EAs each.

These replicates are identified in the NISH sampling frame by the NISHRIC. The sample EAs for most national household surveys such as the GHS are based on a subsample of the NISH master sample, selected as a combination of replicates from the NISH frame.

The GHS is based on a subsample of replicates from the NISH frame. A total of six NISH replicates with 60 EAs for each state was selected for the GHS. For GHS 2010 the sample EAs in the selected replicates for each state are identified in the frame with NISHRIC 10 to 15. The listing for the GHS sample EAs is supposed to be updated each year, but apparently this is not implemented consistently because of limited resources. At the next sampling stage 10 households are selected for the GHS in each sample EA systematically with equal probability from the listing. In this way a total of 2,220 EAs and 22,200 households were selected for the GHS.

The geographic domains of analysis for the Panel Survey are the six geo-political zones of Nigeria. Therefore it was necessary to have a sufficient sample size for each zone to ensure reliable estimates at this level. At the same time, the need for reducing the nonsampling errors and the plans for tracking individual sample households that move limited the sample size that can be managed with sufficient operational and quality control. Given these constraints, a maximum sample size of 5,000 households was considered for the Panel Survey.

The allocation of the 500 sample EAs and 5,000 sample households by zone for the Panel Survey is presented in Table A5.1, which also shows the distribution of the population by zone from the 2006 Nigeria Census results. Given that a similar level of precision is required for the Panel Survey estimates from each zone, a sample of 800 households was allocated to each zone except for the two largest zones, North-West and South-West, which were allocated a slightly larger sample of 900 households each.

Table A5.1: Distribution of population of Nigeria by zone, 2006 Nigeria Population Census, and allocation of sample EAs and households by zone for the Panel Survey

| Zone | 2006 Census population | % | No. of sample EAs | No. of sample households |
|--------------------|------------------------|--------|-------------------|--------------------------|
| North-Central Zone | 20,369,956 | 14.5% | 80 | 800 |
| North-East Zone | 18,984,299 | 13.5% | 80 | 800 |
| North-West Zone | 35,915,467 | 25.6% | 90 | 900 |
| South-East Zone | 16,395,555 | 11.7% | 80 | 800 |
| South-South Zone | 21,044,081 | 15.0% | 80 | 800 |
| South-West Zone | 27,722,432 | 19.7% | 90 | 900 |
| Nigeria | 140,431,790 | 100.0% | 500 | 5,000 |

Given the sample design for the GHS, the weights for this survey vary by the number of EAs in the LGA as well as the number of LGAs in the state. In order to stabilize these weights within each zone for the Panel Survey, the subsample of EAs for the Panel Survey were selected from the GHS sample EAs with probability proportional to size (PPS) within each zone, where the measure of size is based on the factor $N_{sh} * L_s$, where:

N_{sh} = number of EAs in 2006 Nigeria Census frame for LGA h of state s

$L_s =$ number of LGAs in state s

As described later in the description of the weights, this sampling approach resulted in a sample that is approximately self-weighting within zone, as if the EAs had been selected with PPS directly at the first stage within each zone.

3. Reference Population for Longitudinal Survey

It is important to understand that the population of analysis for the Panel Survey corresponds to the sampling frame for the baseline survey, or Wave 1/Visit 1, in which the panel of sample households to be followed was determined. The panel does not represent newer households that came into existence after the baseline survey. In the case of split panel households, only the household in the sample EA with members who do not move is interviewed for the Panel Survey, including any new members of that household. When an entire sample household for the Panel Survey moved out of a sample EA, it was tracked. Therefore there is a one-to-one correspondence between the original panel households that moved and the tracked households. Since the Wave 1/Visit 1 weights were calculated and adjusted at the sample EA level, the weights for the other visits are also calculated at this level.

4. Calculation of Basic Weights for the GHS and Panel Survey

In order for the sample estimates from the data from each survey to be representative of the population, it is necessary to multiply the data by a sampling weight, or expansion factor. The basic weight for each sample household is equal to the inverse of its probability of selection (calculated by multiplying the probabilities at each sampling stage). Since the Panel Survey is based on a subsample of the GHS sample, the probability of selection of the households for the GHS is presented first. Based on the sample design for the NISH and the GHS, the probability of selection for the GHS sample households can be defined as follows:

$$p_{shi} = \frac{30}{N_{sh}} \times \frac{200}{30 \times L_s} \times \frac{60}{200} \times \frac{10}{M_{shi}} = \frac{600}{N_{sh} \times L_s \times M_{shi}}$$

where:

p_{shi} = probability of selection for the GHS sample households in the i -th sample EA in LGA h of state s

N_{sh} = number of EAs in 2006 Nigeria Census frame for LGA h of state s

L_s = number of LGAs in state s

M_{shi} = number of households listed in the i -th sample EA in LGA h of state s

The basic weight for the GHS sample households is the inverse of this probability of selection, calculated as follows:

$$W_{shi} = \frac{N_{sh} \times L_s \times M_{hi}}{600},$$

where:

W_{shi} = basic weight for the GHS sample households in the i-th sample EA in LGA h of state s

Since the Panel Survey is based on a subsample of the GHS, the probability of selection for the sample households in the Panel Survey has an additional component based on the subsampling rate. The sample EAs for the Panel Survey were selected with PPS, where the measure of size is calculated as $N_{sh} \times L_s$. Therefore, the probability of selection for the Panel Survey sample households can be expressed as follows:

$$p_{zshi} = \frac{30}{N_{sh}} \times \frac{200}{30 \times L_s} \times \frac{60}{200} \times \frac{n_z \times N_{sh} \times L_s}{\sum_{s \in z} \sum_{h \in s} \sum_{i \in h} (N_{sh} \times L_s)} \times \frac{10}{M_{shi}} = \frac{600 \times n_z}{M_{shi} \times \sum_{s \in z} \sum_{h \in s} \sum_{i \in h} (N_{sh} \times L_s)},$$

where:

p_{zshi} = probability of selection for the Panel Survey sample households in the i-th sample EA in LGA h of state s in zone z

n_z = number of sample EAs selected for the Panel Survey in zone z

The basic weight for the sample households selected for the Panel Survey is the inverse of this probability of selection, calculated as follows:

$$W_{zshi} = \frac{M_{shi} \times \sum_{s \in z} \sum_{h \in s} \sum_{i \in h} (N_{sh} \times L_s)}{600 \times n_z},$$

where:

W_{zshi} = basic weight for the Panel Survey sample households in the i-th sample EA in LGA h of state s in zone z

It can be seen that the weights of the sample households for the Panel Survey in each zone vary only by number of households listed in the EA, confirming that the PPS subsampling procedures stabilize the Panel Survey weights within each zone.

Following the data collection for the baseline of the Panel Survey (Wave 1, Visit 1), the basic weights for this baseline visit were adjusted to take into account any non-interviews. The weights were adjusted for nonresponse at the sample EA level, as follows:

$$W'_{zi} = W_{zi} \times \frac{m_{zi}}{m'_{zi}},$$

where:

W'_{zi} = adjusted weight for the sample households in the i-th sample EA in zone z for the Panel Survey

m_{zi} = 10 = number of sample households selected in the i-th sample EA in zone z

m'_{zi} = number of sample households with completed Panel Survey interviews in the i-th sample EA in zone z for the Panel Survey

In order to simplify the terminology, the subscript zi will refer to the individual sample EAs selected within a particular zone (stratum); each sample EA is associated with a particular LGA and state within the zone.

In the case of the baseline Panel Survey (Wave 1, Visit 1), almost all of the non-interviews were replaced, so most of the non-interview adjustment factors were equal to 1. The weight adjustment factors for the subsequent visits were calculated in reference to the sample of completed interviews for Wave 1, Visit 1, which determined the panel of sample households to be followed, as described later in this report.

A spreadsheet for calculating the Panel Survey weights by sample EA was developed from the information in the sampling spreadsheet used for selecting the subsample of EAs from the GHS frame. Updated information on the number of households listed in each sample EA and the number of households with completed questionnaires for each visit were entered in this weighting spreadsheet, and formulas were used in the spreadsheet to calculate the weights.

5. Adjustment of Weights for Panel Survey Data Based on Population Projections

After the weighting spreadsheet was updated with the information for the replacement EAs and the geographic codes were consistent with those in the Panel Survey data file, the basic sampling weights were attached to household and person records in the data file for Wave 1, Visit 1. A tabulation of the weighted total population by state was produced from the survey data file to determine whether these results were consistent with the corresponding distribution from the 2006 Nigeria Census. It was found that there were considerable differences for some states, and the weighted survey estimates were mostly lower than the census results, indicating that there was probably under-enumeration of households in the listing for many sample EAs. Conceptually, if there is a new accurate listing of households in each sample EA, the overall growth in the number of households across all the sample EAs would be reflected in the weighted estimates of the total population. The first set of design weights for the baseline Panel Survey were calculated in February 2011 and resulted in a weighted total population estimate of 120,282,653, based on using the original listing of households for the NISH. After that a new listing of households was conducted in the Panel Survey sample EAs in early 2012. The weights were re-calculated using

the updated listing information, and the weighted estimate of the total population increased slightly to 122,242,860, while the 2006 Census population count was 140,431,790. Although the new listing improved the weights slightly, it appears that the new listing also undercounted the households in sample EAs.

One way to adjust the weights for such deficiencies in the listing is to use population projections at the state level for calculating weight adjustment factors. Estimates of the annual population growth rate by state were obtained from the National Population Commission (NPC) in order to calculate population projections by state. The information from the NPC included low, medium and high estimates of the population growth rate for each state; the medium growth rates were used for calculating the population projections. The reference date for the population projections is the mid-point of the data collection period for the 2010 Panel Survey for Wave 1, Visit 1. Since the survey was conducted between 1 September and 15 October 2010, the mid-point was determined as 23 September 2010. The calculation of the population projections by state involved using the population figures for each state from the 2006 Nigeria Census, and applying the annual population growth rate from the census reference date, 21 March 2006, to the survey reference date, assuming an exponential population growth rate. The following formula was used for calculating the population projection for each state:

$$\hat{P}_{S10h} = P_{C06h} \times e^{\ln \left[1 + g_h \times \left(\frac{t_{S10} - t_{C06}}{365} \right) \right]}$$

where:

\hat{P}_{S10h} = estimated total population for state h on 23 September 2010

P_{C06h} = total population for state h from 2006 Nigeria Census (21 March 2006)

g_h = annual population growth rate for state h

$t_{S10} - t_{C06}$ = number of days between the census reference date (21 March 2006) and the mid-point of the 2010 Panel Survey (23 September 2010), that is, 1647 days

The annual population growth rates were not available for the following states: Bayelsa, Ebonyi, Ekiti, Gombe, Nasarawa and Zamfara. Therefore, the national-level annual population growth rate of 2.86% was used for these states. Table A5.2 shows the 2006 Nigeria Census population by state, the estimated population growth rates and the corresponding population projections by state for the mid-point of the data collection period for the baseline Panel Survey.

The weight adjustment factor based on the projected total population by state can be expressed as follows:

$$A_s = \frac{\hat{P}_{2010s}}{\sum_{i \in s} \sum_{j \in i} W'_{si} \times p_{sij}},$$

where:

A_s = adjustment factor for the weights of the baseline Panel Survey sample households in state s

W'_{si} = preliminary design weight for the sample households in the i-th sample EA in state s

p_{sij} = number of persons in the j-th sample household in the i-th sample EA in state s

The denominator of the adjustment factor A_s is the estimated total population in states from the baseline Panel Survey data using the preliminary weights. The preliminary weights for all the sample households within a state are multiplied by the corresponding adjustment factor for the state to obtain the final adjusted weight. After the adjustment factors are applied to the weights of each state, the weighted survey estimates of total population by state are consistent with the corresponding population projections.

Table A5.3 shows the population projections and the weighted survey estimates of total population by state, and the corresponding weight adjustment factor for each state. The estimate of the total population of Nigeria based on the preliminary weights for the Panel Survey was 122,242,860, compared to the projected population of 160,243,147. It can be seen in Table A5.3 that the weight adjustment factors vary from 0.6583 for Yobe to 2.9638 for Ekiti.

6. Nonresponse Adjustment of Weights for Panel Survey Data from each Visit and for Combined Datasets

The adjustment of the weights based on population projections established the final weights for the baseline Panel Survey (Wave 1, Visit 1). The total number of completed household interviews for the baseline survey at that time was 4,987. However, when the new set of weights was being calculated for each visit of the Panel Survey in September 2013, it was found that the Wave 1/Visit 1 data actually had 4,997 completed household interviews. Therefore, a very slight adjustment was made to correct the final baseline weights for a few EAs with a small difference in the number of completed interviews. These baseline (Wave 1/Visit 1) weights were then used as the basis for calculating the weights for the remaining visits as well as for the combined dataset for each wave and a combined dataset for all visits of both waves. For each visit it was necessary to adjust the weights for nonresponse based on the final number of sample EAs covered in each zone, and the number of completed household interviews in each sample EA for that visit. The reason for this approach is that the baseline survey represents the national frame of households that is being followed each visit. In the case where a panel sample household moves, it is tracked; if it is not found or cannot be interviewed, the baseline weight for the corresponding EA is adjusted to reflect this type of non-interview as well as the non-interviews for sample panel households in that EA that did not move.

In the case of the two visits for Wave 2, there were a few sample EAs with no completed household interviews. There were five sample EAs with zero households interviewed in Wave 2/Visit 1 and three such sample EAs in Wave 2/Visit 2. In this case it was necessary to have an additional adjustment of the corresponding weights at the zone (stratum) level to take into account the sample EAs without survey data. In the case of sample EAs that have zero households interviewed for a particular wave/visit, no weight appears in the weighting file. The weights will only be attached to the household records in each EA that have an interview status of 1 (completed) for the corresponding wave/visit.

In the case of Wave 2/Visit 1, there were 143 sample household records who were administered a combined questionnaire of post-planting and post-harvest sections; this is the only wave/visit with such cases. The weights calculated for this visit and the combined files treated these sample households as non-interviews. If these partially completed interviews are included in the data for the analysis of particular sections of the questionnaire, conceptually it would be necessary to calculate a separate set of weights for each section. Since the poverty indicator and other consumption-related indicators depend on having complete consumption data, it would be necessary to exclude the households that are missing consumption data, so the weights should be calculated accordingly. For this reason, the final weights for the Panel Survey are only based on households with completed interviews.

The previous "population weights" in the Panel Survey data file were calculated in March 2012, based on 4,987 households with completed interviews for the baseline survey. As mentioned previously, there are 4,997 households with completed interviews in the current data file for the Panel Survey of Wave 1/Visit 1. The source of this difference is not clear, but this required a slight adjustment to the baseline weights so that the data for the 4,997 household records are

correctly weighted up to the frame level. These adjusted weights for Wave 1/Visit 1 became the base weights for the panel households. In order to calculate the weights for the subsequent visits, it was necessary to adjust the weights for each wave/visit for nonresponse at the EA level.

The final weights for each visit, calculated at the sample EA level, can be expressed as follows:

$$W_{(wv)zi} = W'_{(11)zi} \times \frac{m'_{(11)zi}}{m'_{(wv)zi}} \times \frac{n_z}{n'_{(wv)z}},$$

where:

$W_{(wv)zi}$ = final (adjusted) weight for the panel sample households in the i-th sample EA in zone (stratum) z for the Panel Survey in Wave w and Visit v

$m'_{(11)zi}$ = number of sample households with completed interviews for the i-th sample EA in zone z, for the baseline Panel Survey (Wave 1, Visit 1)

$m'_{(wv)zi}$ = number of sample households with completed interviews in the i-th sample EA in zone z for the Panel Survey in Wave w and Visit v

n_z = original number of sample EAs selected for the Panel Survey in zone z

$n'_{(wv)z}$ = number of sample EAs in zone z with data (completed household interviews) for the Panel Survey in Wave w and Visit v

For the two visits of Wave 1 there were completed interviews in all the sample EAs, so the last adjustment factor was equal to 1 for all zones.

In the case of the Panel Survey data file for each wave with combined data from both visits, the analysis will be limited to the sample households that were successfully interviewed both times. In the same way, the weights for the combined data file from all waves and visits were based on the households with completed interviews for all visits. The weights for these combined files were also adjusted to represent the baseline frame.

In the case of the combined visits for each wave, the adjusted weight was calculated in a similar manner as follows:

$$W_{(w)zi} = W'_{(11)zi} \times \frac{m'_{(11)zi}}{m'_{(w)zi}} \times \frac{n_z}{n'_{(w)z}},$$

where:

$W_{(w)zi}$ = final (adjusted) weight for the panel sample households in the i-th sample EA in zone (stratum) z for the combined data from the Panel Survey for

both visits of Wave w

$m'_{(w)zi} =$ number of sample households with completed interviews for both visits of the Panel Survey for Wave w , in the i -th sample EA in zone z

$n_{(w)z} =$ number of sample EAs in zone z with data (completed household interviews) for both visits of the Panel Survey in Wave w

Finally, the weights for the combined data file of the Panel Survey for all waves and visits were calculated as follows:

$$W_{(all)zi} = W'_{(11)zi} \times \frac{m'_{(11)zi}}{m'_{(all)zi}} \times \frac{n_z}{n'_{(all)z}},$$

where:

$W_{(all)zi} =$ final (adjusted) weight for the panel sample households in the i -th sample EA in zone (stratum) z for the combined data from the Panel Survey for the visits from all waves

$m'_{(all)zi} =$ number of sample households with completed interviews for the visits from all waves of the Panel Survey, in the i -th sample EA in zone z

$n'_{(all)z} =$ number of sample EAs in zone z with data (completed household interviews) for the visits from all waves of the Panel Survey

These final weights for the combined Panel Survey datasets assume that the data are merged into one record for each sample household, so that the longitudinal analysis can examine trends in characteristics at the household level. However, if the data files are merged with separate household records for each visit, all the corresponding weights should be divided by the number of visits combined, so that total weighted number of households from the survey data will represent the frame for the baseline survey.

7. Calculation of Weights for Panel Survey Wave 3 and for the Combined Datasets

Since the same sample of panel households was maintained since the baseline Panel Survey, the panel weights for Wave 3 were calculated by adjusting the corresponding weights from Wave 1, Visit 1, based on the number of sample EAs that were covered in each zone and the number of households with completed interviews in each sample EA. This is the same methodology described above for the previous waves. The baseline panel weights had already been adjusted based on a new listing in 2012 as well as population projections. Given the longitudinal nature of the Panel Survey, the sample households still represent the frame at the time of the baseline survey.

Reference can be made to the formulas of the weights defined in the previous section. For each visit of Wave 3 it was necessary to compile data for the following components of the weight adjustment factors:

$m'_{(3v)zi}$ = number of sample households with completed interviews in the i -th .
sample EA in zone z for the Panel Survey in Wave 3 and Visit v

$n'_{(3v)z}$ = number of sample EAs in zone z with data (completed household
interviews) for
the Panel Survey in Wave 3 and Visit v

The number of enumerated sample EAs for a particular visit of Wave 3 ($n'_{(3v)z}$) is obtained at the zone level, while the number of completed household interviews is counted at the sample EA level. This information was copied into additional columns of the previous weighting spreadsheet, followed by a column with the formula for the weight. Table A5.4 shows a summary of the total number of sample EAs and households with completed interviews for the combined visits of Wave 3. These results can be compared to Table A5.1 to examine the level of attrition in the panel.

Separate weights were also calculated for the combined data from different waves, for conducting the longitudinal analyses. In each case it was necessary to determine the number of sample EAs in each zone with interviews for all the combined waves, as well as the number of households in each sample EA that had completed interviews for all the combined waves. It should be noted that in Wave 3 an attempt was made to interview all the baseline sample households, even if some of them were not interviewed in Wave 2. The same formula was used for adjusting the baseline weights for nonresponse for each combined dataset.

Table A5.4 Distribution of the effective number of sample EAs and households with completed interviews by zone for the combined visits of Wave 3 of the Panel Survey

| Zone | No. of sample EAs with panel data | No. of household interviews completed |
|--------------------|--|--|
| North-Central Zone | 80 | 777 |
| North-East Zone | 66 | 643 |
| North-West Zone | 90 | 882 |
| South-East Zone | 80 | 755 |
| South-South Zone | 80 | 744 |
| South-West Zone | 90 | 780 |
| Nigeria | 486 | 4,581 |

It can be seen in Table A5.4 that all of the sample EAs were enumerated in Wave 3 except for 14 sample EAs in the North-East Zone. A total of 4,581 panel households were interviewed in Wave 3 (both visits), indicating an attrition rate of about 8.4% since the baseline survey.

Appendix 6: Changes to the Data

January 2019

Consumption Aggregates

- Annual consumption expenditures added for each visit (*cons_agg_wave3_visit1.dta* and *cons_agg_wave3_visit2.dta*). Documentation on the methodology and data sets can be found in Appendix 7.

Food conversion factors and food consumption files

- Additional conversion factors have been added to *food_conv_w3.dta* for some item-unit combinations that were previously missing conversions. In addition to new conversion for coded units, there are now some “other” units (that came under “other specify”) that now have conversions available. The food consumption files (*sect7b_plantingw3.dta* and *sect10b_harvestw3.dta*) have been updated to allow merging with the new format of the conversion file. Now you must merge the food consumption files on the variables *item_cd*, *unit_cd*, & *unit_other* in *food_conv_w3.dta* in order to get the full range of conversion factors.

Household Weights

- A minor discrepancy in the household counts used in calculation of the weights in 2 EAs was discovered and corrected.
- Variables affected: *wt_w3v1*, *wt_w3v2*, *wt_wave3*, *wt_w1_w3*, *wt_w2_w3*, & *wt_w1_w2_w3*

Appendix 7: Summary Description of Consumption Aggregate Construction

Introduction

1. **Objective.** This note summarizes the principle and decisions taken to construct the consumption aggregate from Nigeria’s General Household Survey – Panel “GHS-Panel”. The GHS-Panel questionnaire is based on the living standards measurement survey; it is a multi-topic survey that can be used to measure consumption.

2. **Survey Structure.** Data collection for the GHS-Panel was carried out in three waves with each household visited twice in each wave. The three waves occurred as follows:

Wave 1: 2010/2011

Wave 2: 2012/2013

Wave 3: 2015/2016

Each wave consisted of two visits to households. Visit 1 data were collected during the months of September, October and November of the calendar year, designated as “post-planting” agricultural season. Visit 2 data were generally collected during the months of February, March and April of the following calendar year – “post-harvest” agricultural season. Households who moved/migrated have been tracked when/if possible. However, it should be noted that Nigeria is a large country with different climatic zones so the designations of post-planting and post-harvest might not always be correct for all parts of the country.

3. **Consistency.** Some questionnaire sections or modules were not administered constantly across years and/or visits. For example, Section 8 (housing and utilities) and durables were present in Wave 3-Visit 1, but not in Wave 3-Visit 2. Education expenditures were available in Wave 3-Visit 2, but not in Wave3-Visit 1. Thus, the computation and structure of the consumption aggregate varies slightly year to year (visit to visit) but with the aim of maintaining comparability across the survey waves.

4. **Consumption Aggregate Components.** The consumption aggregate is the sum of household consumption expenditures of four groups:

(1) Food

(2) Education

(3) Non-food, including, Clothing, Fuel, Electricity, Utilities, Transportation, Communication, Recreation and Other Services

(4) Imputed Housing Rent

Food

5. **Recall period.** The food module is administered with a recall of the past 7 days.

6. **Categories.** The food consumption module covers about 16 general food categories (grains, flour, tubers, cereals, baked food, etc.), and alcohol. Altogether, there are 116 food items (including drinks and alcohol). The survey includes questions on the source of the food consumption, i.e., purchased, own production and from other sources (gift, etc.). In addition, the food consumption component includes the expenses on food and meals consumed away from home.

7. **Valuation.** General principle of valuation of food consumption is to use unit values, derived from reported purchases, and quantities consumed from all sources (purchased, own and other sources). There are several challenges in deriving the unit values and consumption expenditures: (i) units of measurement of food from various sources are different (also, the units of measurement are different in various waves/visits); (ii) quantities of food from various sources do not always add up to total quantity consumed; and (iii) either only quantity or value is reported.

8. **Unit Values.** To the extent possible the various units of measurement are normalized to the common unit of measurement (i.e., kilogram, liter, etc.). If a household reported a purchase of the food item, the unit values are taken at the household level. In other cases, the unit values represent the median values for specific food item at the smallest strata, that is, enumeration areas (“EAs”), state, zone, country, conditioned that the number of unit values per strata is no less than 30. In cases, when only total food consumption was available (i.e., no information on sources) and when total food consumption was higher than sum of its source components, the total food consumption was taken (i.e., largest value).

9. **Annual food consumption.** Food consumption is valued at the level of specific food item. The efforts are made to replace the outliers, i.e., values higher than 3 standard deviation from the mean have been replaced by median values (except in wave 3⁶), which are believed to represent the measurement/data entry errors. Subsequently, the food consumption is annualized by multiplying the 7-day consumption by factor of 52.14. The last step is to aggregate the food consumption to 16 food grouping levels (plus alcohol and food away from home), for purchased and own source food separately.

10. **Nominal food consumption** represents the annual value of per capita food consumption in each visit/year, without price (spatial and temporal) adjustments.

Education

11. **Recall period.** The recall period is for one school/academic year.

12. **Education expenditures** represent the annual per capita spending on education and related expenses (tuition, books, transport, etc.) in each visit/year, without price (spatial and temporal) adjustments.

⁶ The questionnaire for Wave 3 was improved to reduce the occurrence of outliers by reducing the application of non-standard units of measurement.

Non-Food

13. **Recall period.** The recall period varies by category and for 7 days, 1 month, 6 months, and 12 months

14. **Categories.** GHS-Panel collects data on purchases of an extensive set of non-food items and services:

- (1) Recreational and culture items: newspapers, magazines, cinemas, etc.
- (2) Energy: kerosene, liquid gas, diesel, charcoal, etc.
- (3) Utilities: water, electricity, garbage disposal, etc.
- (4) Clothing and footwear
- (5) Personal care items: soaps, cosmetics, vitamins etc.
- (6) Household goods, maintenance and services: dwelling repairs, small furnishings, domestic services, small electric appliances, etc.
- (7) Communication: transportation, postal, internet, phone charges, etc.

15. **Treatment of large purchases.** Non-food expenditures are valued at purchase or self-reported monetary value. Non-food expenditures exclude large expenses like mortgage, ceremonial spending (funerals, weddings, dowries etc.). Also, given that the questionnaire does not contain information on the initial cost/price of durables (for example, auto, washing machine, air conditioner etc.) the decision was taken to exclude the use value of durables from the consumption aggregate.

16. **Reference period.** Various non-food items have different reference period corresponding to the likely frequency of purchases. Depending on the reference period the expenditures are annualized and the efforts are made to replace the outliers (i.e., values higher than 3 standard deviation from mean have been replaced by median values (except in wave 3)). Final step is to dis-aggregate the non- food expenditures into to 3 groups: (i) fuel and utilities; (ii) transportation and (iii) other non-food.

17. **Nominal non-food expenditures** represent the annual value of per capita non-food expenditures in each visit/year, without price (spatial and temporal) adjustments.

Housing rent

18. **Recall period.** Recall of paid housing rent of 30 days

19. **Imputed rent.** A hedonic regression model is applied to estimate/predict the rent, which could be viewed as monetary flow of services received by household from occupying the dwelling. The dependent variable is actual rent paid, regressed on a set of housing variables like, location, number of rooms, material of roof, material of floor, material of wall, amenities/utilities

(toilet, bathroom types, water sources, electricity connection etc.). The imputed rent is predicted value of housing applied to all households and represents the annual per capita value in each visit/year, without price (spatial and temporal) adjustments.

Weights

20. The file contains household, cross-sectional weight variable that directly matched from *HHTrack* file; No post-stratification (i.e. calibration) of weights was carried out.

Consumption aggregate

21. The attached data file contains raw consumption aggregate variable, “*totcons*”, which is calculated as a sum of all food, total education, all non-food expenditures and total imputed rent. Like its components the aggregate is presented in annual, per capita terms for each visit/year, without price (spatial and temporal) adjustments. Important to note, that the GHS-Panel based consumption aggregate is not used for official monitoring of poverty in Nigeria.
