

Tajikistan Living Standards Survey, 2003

Notes for Users of the Data

The Tajikistan Living Standards Survey (TLSS) for 2003 was based on a stratified random probability sample, with the sample stratified according to oblast and urban/rural settlements and with the share of each strata in the overall sample being in proportion to its share in the total number of households as recorded in the 2000 Census. The same approach was used in the TLSS 1999 although there were some differences in the sampling. First the share of each strata in the overall sample in 1999 was determined according to ‘best estimates’, as it was conducted prior to the 2000 Census. Second the TLSS 2003 over-sampled by 40 percent in Dushanbe, 300 percent in rural Gorno-Badakhshan Administrative Oblast (GBAO) and 600 percent in urban GBAO. Third the sample size was increased in 2003 in comparison with 1999 in order to reduce sampling error. In 2003, the overall sample size was 4,156 households compared with 2,000 households in 1999.¹

In addition to the capital city of Dushanbe, the country has several oblasts (regions): (i) Khatlon (comprising Kurban-Tube and Khulyab), which is an agricultural area with most of the country’s cotton growing districts; (ii) the Rayons of Republican Subordination (RRS) with the massive aluminum smelter in the west and agricultural valleys in the east growing crops other than cotton; (iii) Sugd which is the most industrialized oblast; and (iv) Gorno-Badakhshan Administrative Oblast which is mountainous and remote with a small population.

The 2003 data are representative at the regional level (4 regions) and urban/rural.

This is not a panel survey with the Tajikistan Living Standards Survey done in 1999.

The weight variable is `wgt_nat`.

Household Expenditures are expressed as monthly expenditures. Neither 1999 or 2003 included imputed rent as part of the calculation of household expenditures. The expenditure aggregates were calculated using similar methodologies in the two years. Some differences in the questionnaires resulted in some differences in the individual components of the aggregates.

Household Income is expressed as monthly income. The income aggregates for 1999 and 2003 are calculated in similar ways, but there are differences caused by changes to the questionnaires between the two years.

The Supervisor/Interviewer Manual as provided was written before the final version of the questionnaire. There are differences in the numbering of the modules in the questionnaire and in the manual.
