

**Ethiopia Socioeconomic Survey (ESS)
Wave Three (2015/2016)**

Basic Information Document

**Central Statistical Agency
&
Living Standards Measurement Study (LSMS), World Bank
February 2017**

ACRONYMS

AgSS	Annual Agricultural Sample Survey
BMGF	Bill and Melinda Gates Foundation
CSA	Central Statistical Agency (Ethiopia)
DHS	Demographic and Health Survey
EA	Enumeration Area
EIAR	Ethiopia Institute of Agricultural Research
ERSS	Ethiopia Rural Socioeconomic Survey
ESS	Ethiopia Socioeconomic Survey
HCES	Household Consumption and Expenditure Survey
IFPRI	International Food Policy Research Institute
LSMS-ISA	Living Standards Measurement Study – Integrated Surveys on Agriculture
MOA	Ministry of Agriculture
MOFED	Ministry of Finance and Economic Cooperation
MOWIE	Ministry of Water, Irrigation & Electricity
NPC	National Planning Commission
NSDS	National Strategy for the Development of Statistics
WB	World Bank
WFP	World Food Program

1. Introduction

The Ethiopian Socioeconomic Survey (ESS) is a collaborative project between the Central Statistics Agency of Ethiopia (CSA) and the World Bank Living Standards Measurement Study-Integrated Surveys of Agriculture (LSMS-ISA) project.¹ The objective of the LSMS-ISA is to collect multi-topic panel household level data with a special focus on improving agricultural statistics and the link between agriculture and other household income activities. The idea of the ESS is rooted in the need to develop and implement a multi-topic survey that meets Ethiopia's data demands and gaps, is of high quality, accessible to the public, and aligned with the National Strategy for the Development of Statistics (NSDS). The project also aims to build capacity, share knowledge across countries, and improve survey methodologies and technology. In implementing the ESS, the CSA has established a framework to facilitate consultations with national and international organizations that would provide technical guidance and later utilize the data for policy decision-making and research purposes. These institutions include the Ministry of Agriculture (MOA), Ministry of Finance and Economic Cooperation (MOFEC), National Planning Commission (NPC), Agricultural Transformation Agency, World Food Program (WFP), International Food Policy Research Institute (IFPRI), Ethiopia Institute of Agricultural Research (EIAR), National Bank of Ethiopia (NBE), and Ministry of Water, Irrigation and Electricity (MOWIE).

Ethiopia is one of seven countries being supported by the World Bank, through funding from the Bill and Melinda Gates Foundation (BMGF), to strengthen the production of household-level data on agriculture. The LSMS-ISA, has the over-arching objective of improving our understanding of agriculture in Sub-Saharan Africa – specifically, its role in household welfare and poverty reduction. The implementation will boost the data collection capacity of the national statistical organizations and the quality of household-level agriculture statistics. Also, the data will provide the basis of analyses looking for insights into how innovation and efficiency can be fostered in the agriculture sector.

ESS began as ERSS (Ethiopia Rural Socioeconomic Survey) in 2011/12. The first wave of data collection in 2011/12 included only rural and small town areas. The survey name dropped the word “Rural” in the second wave of data collection when the sample was expanded to include all urban areas. The urban supplement was done in such a way to ensure that the ESS data can provide nationally representative estimates. Accordingly, the number of enumeration areas (EAs) covered by the survey increased from 333 (or 3,776 households) to 433 (or 5,262 households). For the rest of this document, ESS will refer generally to the survey, ESS1 will refer to the first wave of the ESS carried out in 2011/12²; ESS2 will refer to the second wave of the ESS carried out in 2013/14 and ESS3 will refer to the third wave of the ESS carried out in 2015/2016. ESS1, ESS2, and ESS3 together create a panel data set of households from rural and small town areas (ie. the same households that were interviewed in ESS1 were tracked and re-interviewed in ESS2 and ESS3). ESS2 and ESS3 together represent a panel of households and individuals for rural and all urban areas.

¹ For more information on the LSMS and LSMS-ISA go to www.worldbank.org/lsms

² In other words, ESS1 is the new term now used to refer to the ERSS.

Several innovative approaches were incorporated in the ESS:

- ◆ Integration of household welfare data with agricultural data;
- ◆ Creation of a panel dataset that can be used to study poverty dynamics, the role of agriculture in development and the changes over time in health, education and labor activities, *inter alia*;
- ◆ Collection of information on the network of buyers and sellers of goods with which the household interacts;
- ◆ Expanding the use of GPS units for measuring agricultural land areas;
- ◆ Data collection using CAPI (Computer Assisted Personal Interview)
- ◆ Implementing concurrent data entry using a decentralized data entry arrangements;
- ◆ Involvement of multiple actors in government, academia and the donor community in the development of the survey and its contents as well as its implementation and analysis;
- ◆ Tracking of households who have left their original location for other places in the country;
- ◆ Active dissemination of agriculture statistics.

ESS2 and ESS3 covered all regional states including the capital, Addis Ababa. The majority of the sample comprises rural areas as it was carried over from ESS1. The ESS2 and ESS3 were implemented in 433 enumeration areas (EAs) out of which 290 were rural, 43 were small town EAs from ESS1, and 100 were EAs from major urban areas.

ESS is a long-term project to collect panel data. The project responds to the data needs of the country, given the dependence of a high percentage of households in agriculture activities in the country. The ESS collects information on household agricultural activities along with other information on the households like human capital, other economic activities, access to services and resources. The ability to follow the same households over time makes the ESS a new and powerful tool for studying and understanding the role of agriculture in household welfare over time as it allows analyses of how households add to their human and physical capital, how education affects earnings, and the role of government policies and programs on poverty, *inter alia*. The ESS is the first panel survey to be carried out by the CSA that links a multi-topic household questionnaire with detailed data on agriculture.

The purpose of this Basic Information Document (BID) is to provide detailed information on the third wave of the survey fielded by the CSA in 2015-16.

2. The Survey Instruments

The survey consisted of five questionnaires. These questionnaires are similar with the questionnaires used during in the ESS1 and ESS2 with revisions based both on the results of the ESS2 and also on identified areas of need for new data (see Section 7). The *household questionnaire* was administered to all households in the sample. The *community questionnaire* was administered to a group of community members to collect information on the socio-economic indicators of the enumeration areas where the sample households reside.³ The three *agriculture questionnaires* consisting of a *post-planting agriculture questionnaire*, *post-harvest agriculture questionnaire* and *livestock questionnaire* were administered to all household members (agriculture holders) who are engaged in agriculture activities. A holder is a person who exercises management control over the operations of the agricultural holdings and makes the major decisions regarding the utilization of the available resources. S/he has technical and economic responsibility for the holding. S/he may operate the holding directly as an owner or as a manager. Hence it is possible to have more than one holder in single sampled households. As a result we have administered more than one agriculture questionnaire in a single sampled household if the household has more than one holder.

Household questionnaire: The household questionnaire provides information on basic demographics; education; health (including anthropometric measurement for children); labor and time use; saving; food and non-food expenditure; household nonfarm income-generating activities; food security and shocks; safety nets; housing conditions; assets; credit; and other sources of household income (Table 2.1). Household location is geo-referenced in order to be able to later link the ESS data to other available geographic data sets (See Appendix 1 for discussion of the geo-data provided with the ESS).

Community questionnaire: The community questionnaire solicits information on infrastructure; community organizations; resource management; changes in the community; key events; community needs, actions and achievements; and local retail price information (Table 2.2).

Agriculture questionnaire: The post-planting and post-harvest agriculture questionnaires focus on crop farming activities and solicit information on land ownership and use; farm labor; inputs use; GPS land area measurement and coordinates of household fields; agriculture capital; irrigation; and crop harvest and utilization. The livestock questionnaire collects information on animal holdings and costs; and production, cost and sales of livestock by products (Table 2.3). The livestock module implemented in ESS3 is significantly difference from the module implemented in ESS1 and ESS2.

³ The community questionnaire does not collect information from communities in the sociological sense. The data cannot be used to represent communities in Ethiopia. The data collected at the community level represent information that is common to the households selected for inclusion in the selected sample EAs.

Table 2.1: Household Questionnaire

Section	Topic	Respondent	Description	New questions added in the third wave
Cover	Cover	Field staff	Household location identification; household size and head's name; field staff identification; and observation notes by enumerator regarding the interview.	
1	Roster	Household head or spouse.	Roster of individuals living in the household and basic demographics; for members less than 18, parental education and occupation.	
2	Education	Household members 5 years and above	Educational attainment, enrollment, attendance, school characteristics, and expenditures for the 2015-16 academic year. ⁴	-
3	Health	Household members	Health problems, types of injury/illness, medical assistance/consultation, disabilities, and anthropometrics (children under seven years). ⁵	Health Insurance, Health Expenditure
4	Labor and Time Use	Household members 7 years and above	Labor market participation during the last seven days, participation in food for work/ public works programs, and participation in domestic activities.	-
4B	Banking and Finance	Household members 18 years and above	Saving and banking practices	All in this section
5A	Food Consumption Last 7 days	Person responsible for household purchases	Food consumption (quantity and value) by any household member in the last 7 days by source for a subset list of food items.	The food items list have increased from 26 items to 55 items. Please see Annex 3 for the list of consumption items added in wave 3
5B	Food Aggregate Last 7 days	Person responsible for household purchases	Summary on consumption of food in the last 7 days. Meal sharing with non-household members, meal away from home.	
6	Non-food Expenditure	Person responsible for household purchases	Household expenditures on non-food items.	-
7	Food Security	Household head or eligible adult	Food security status of households in during the past 7 days/12 months.	-
8	Shocks	Household head or eligible adult	Shocks during the last 12 months and their impact on income, assets, food production, stock and purchase.	
9	Housing	Household head or eligible adult	Dwelling ownership, and characteristics of the dwelling and utilities.	Water and energy related questions are modified

⁴ The 2013-14 school year started in September 2013 and ended in July 2014.

⁵ First wave measured children under five.

Section	Topic	Respondent	Description	New questions added in the third wave
10	Household assets	Household head or eligible adult	Household ownership of assets.	
11	Non-farm Enterprises	Owner or manager of enterprise	Characteristics of enterprises owned by the household.	
12	Other Income	Household head or eligible adult	Others sources of household income during the last 12 months.	-
13	Assistance	Household head or eligible adult	Assistance provided to the household by governmental and non-governmental agencies.	-
14	Credit	Household head or eligible adult	Loans or credit received by the household.	-
15	Contact information	Household head or eligible adult	Contact information. (Confidential-not included in the public data)	-

Table 2.2: Community Questionnaire

Section	Topic	Respondent	Description	New questions added in the third wave
Cover (1.1&1.2)	Cover	Field staff	Community location identification; field staff identification; date and time of interviews.	
Cover (1.3)	Cover	Direct Observation by the Field Staff	Community characteristics.	
2	Roster of Informants	Informants	Respondent characteristics.	
3	Community Basic Information	Informants	Mobility, population, religion, marriage types, common land use.	
4	Access to Basic Services	Informants	Transportation, markets, proximity to the nearest town and major urban centers, electrification, bank and microfinance institutions, piped water.	Questions related to financial services (q52-59). ATM, SACO, Agent bank and Insurance
5	Economic Activities	Informants	Main sources of employment, migration to and from the locality for work, cooperatives and microenterprises.	
6	Agriculture	Informants	Agricultural activities, including major crops, main planting and harvesting seasons, rain seasons, input use, agricultural extension, and irrigation.	
7	Changes	Informants	Important events in the community in the last five years.	
8	Community Needs and Actions	Informants	Initiation, participation and mobilization of resources for community projects including roads, school, health facility, water, natural resource management, public transport, agriculture, law enforcement, etc.	
9	Productive Safety nets Program	Informants	Participation in the productive safety nets program. Management and performance of the program in the community.	-
10A	Market Prices	Sellers in the nearby market-Market center 1	Market prices in the first closest market center.	

Table 2.3: Post-planting Questionnaire⁶

General Note: in the previous two rounds the Post Planting module was a separate questionnaire from the Livestock Modules. In this wave both were fielded during the post planting visit in September-October 2015. Therefore, there is only one cover page for both modules.

Section	Topic	Respondent	Description	New questions added in the third wave
Cover	Cover	Field Staff	Holder ⁷ location identification; household head name, holder name, household size, agriculture holding type (farming, livestock, or both); field staff identification.	
1	Household Roster	Household head or eligible adult	Name, age, and gender of each household member and holding type (farming, livestock or both).	-
2	Parcel Roster	Owner or manager of the parcel	Information on all parcels owned and/or managed by the holder:	
3	Field Roster	Field Staff (for field measurements using GPS or rope and compass). Manager of field for other questions.	Information on all fields (sub-parcels) owned and/or managed including holder reported self-reported area, GPS or rope and compass measured area, labor inputs, and other details on the fields.	Questions about new fertilizer type (NPS) is added in this round (q20a-1 - 20a-7). Method of irrigation (q13b) is also added in this round. New questions about method of farming, crop residue cover and plough type were also added in Wave3 (q35-38)
4	Crop Field Roster	Manager of field	Crop planting/management information for each crop on each field.	type of chickpea flower (q12c), Sweet potato skin and flesh color (q18-19), self-reported forecasted production and sales of production (q20- 23)
5	Seeds Roster	Manager of field	Seed related information for each crop planted on each field.	Section reorganized. Presented by seed type. 0a, 0b and 1b new questions on seed type and crop code.
7	Miscellaneous	Manager of field	Information on holder characteristics including chemical fertilizer use, and access and use of credit, extension/advisory services.	Fertilizer questions revised and new questions added to include new fertilizer type (NPS): (15a-b), New questions about Weather Index insurance and agriculture hotline added in this round (q20a-f)
NR	Network Roster	Manager of field	Roster of individuals, places or businesses from/where the holder purchases agricultural inputs.	

⁶ There is no Section 6 in the post-planting questionnaire.

⁷ A holder is a person who exercises management control over the operations of the agricultural holdings and makes the major decisions regarding the utilization of the available resources. S/he has technical and economic responsibility for the holding. S/he may operate the holding directly as an owner or as a manager.

Table 2.4: Post-harvest Questionnaire

During this round we have changed the codes for nonstandard units for all sections of this questionnaire.

Section	Topic	Respondent	Description	New questions added in the third wave
Cover	Cover	To be completed by the field staff	Holder location identification; household head name, holder name, household size, agriculture holding type (farming, livestock, or both). Field staff identification.	
1	Household Roster	Household head or eligible adult.	Name, age, and gender of each household member and holding type (farming, livestock or both).	
9	Crop cut/	Field staff (for the 4mX4m crop cut) & Holder/ Manager of field	Crop cut information for selected fields including fresh and dry weight (from a 4mX4m crop cut). This section excludes permanent, tree and root crops. Crop cut only for 23 crop types.	The number of crop cut fields per crop per EA has increased from 5 fields to 10 fields.
9	Crop Harvest by Field	Holder/ Manager of field	All crops- harvest information. Information on crop use, area harvested, amount harvested and damage to crops.	
10	Harvest Labor	Holder/ Manager of field	Hired and household member labor used in harvest activities for each crop on each field. This section excludes permanent, tree and root crops.	-
11	Crop Disposition / Sales	Holder/ Manager of field	Crop disposition/sale information. This section excludes permanent, tree and root crops.	
12	Crop Disposition / Sales (Tree / Permanent and Root Crops)	Holder/ Manager of field	Harvest information on permanent, tree, and root crops.	
NR	Network Roster	Manager of field	Roster of individuals, places or businesses to/where the holder sells crops.	-

Table 2.5: Livestock Questionnaire

Section	Topic	Respondent	Description	Remark
Cover	Cover	To be completed by field staff	Holder location identification; household head name, holder name, household size, agriculture holding type (farming, livestock, or both). Field staff identification.	Cover page for livestock questionnaire is the same as the post planting questionnaire.
1	Household Roster	Household head or eligible adult	Name, age, and gender of each household member and holding type (farming, livestock or both).	This section is the same as the Post planting questionnaire
8_1	SECTION 1: OWNERSHIP	Holder or manager/owner of livestock	Characteristics of livestock owned and purpose of livestock owned	
8_2	SECTION 2A: CHANGE IN STOCK	Holder or manager/owner of livestock	Total number of livestock names last year and changes on livestock number due to birth, , purchased, gifts received, gifts given out or received, sold, lost, slaughtered etc.	
8_3	SECTION 3. BREEDING	Holder or manager/owner of livestock	livestock breeding methods and cost of breeding	
8_4	SECTION 4. HOUSE, WATER, AND FEED	Holder or manager/owner of livestock	Livestock shelter type, feed type and sources	
8_5	SECTION 5: ANIMAL HEALTH	Holder or manager/owner of livestock	Livestock treatment and cost of treatments	
8_6	SECTION 6: MILK AND EGG PRODUCTION	Holder or manager/owner of livestock	Milk and egg production quantity production, disposition and income from milk and egg production	
8_7 (a and b)	SECTION 7: ANIMAL POWER AND DUNG	Holder or manager/owner of livestock	Livestock use for transport and power as well as livestock dung production and use	

3. Sample Design

3.1 Wave 1 coverage, Rural and small towns (ESS1)

The ESS sample coverage and design changed over the first two waves of data collection. In wave 1, the ESS1 sample was designed to be representative of rural and small town areas in Ethiopia.⁸ The ESS sample is drawn from a population frame that includes all areas of Ethiopia except for three zones of Afar and six zones of Somalie region.⁹ The frame for rural areas is the 2011/2012 Agricultural Sample Survey (AgSS), so the ESS rural sample is a complete subset of the AgSS sample. The small town and urban area samples come from the universe of small town and urban EAs, excluding the same three zones of Afar and six zones of Somalie. The wave 1 sample design provides representative estimates for all rural-area households and for the combination of rural-area and small-town households (excepting the 9 zones excluded from the frame).

The wave 1 sample design is a stratified, two-stage design where the regions of Ethiopia serve as the strata. Quotas were set for the number of EAs in each region to ensure a minimum number of EAs are drawn from each EA. The data is representative at the regional level for the most populous regions: Amhara, Oromiya, SNNP, and Tigray. The sample size is insufficient to support region-specific estimates for each of the small regions including Afar, Benshangul Gumuz, Dire Dawa, Gambella, Harari, and Somalie regions. However, estimates can be produced for a combination of all smaller regions as one “other region” category. For the purpose of sub-national analysis, there are 5 representative domains of analysis: Amhara, Oromiya, SNNP, Tigray and all other regions combined as one category.

3.2 Wave 2 and 3 coverage, Rural and all urban areas (ESS2 and ESS3)

In part due to the success of the first wave of data collection, the Government of Ethiopia decided to invest in an urban sample supplement to the ESS1 sample. The key objective of the urban expansion is to ensure that the ESS2 and subsequent surveys will be able to provide inferences to all of Ethiopia, and not just rural areas and small towns. To reach this objective, the ESS1 sample was supplemented with an urban sample that was drawn independently from a stratified urban frame of households.

A secondary objective of the expansion was to ensure that one can also make inferences to the population of urban households. This requires both that the urban sample is a separate stratum and also that it is of sufficient size to provide adequate precision for the urban estimates. In order to be more specific, adequate precision was set to mean that the estimated relative standard error (RSE) of the mean of consumption in urban areas is approximately the same size as the RSE for

⁸ The CSA defines small towns based on population estimates from the 2007 Population Census; a town with the population of less than 10,000 is a small town.

⁹ Zones excluded from the sampling frame include Zones 2, 4, and 5 in the Afar Region and Zones 3, 4, 5, 6, 7, and 8 in the Somali Region.

the mean of consumption as estimated in ESS1.¹⁰ This rule helped guide the size of the urban supplement.

Prior to expanding the sample, CSA and the World Bank team examined potential options for expansion based on the criteria of providing approximately the same level of precision with the urban estimates of consumption as is obtained with the rural estimates of consumption. To assess the needed sample size, the team used urban estimates of the overall variance and within cluster variance of consumption from the national Household Consumption and Expenditure Survey (HCES). The level of within cluster variance in urban areas as estimated by the HCES is significantly less than estimates of within cluster variance in rural areas. An implication of this is that a relatively small urban supplement would be adequate to provide sufficient power to meet the objectives.¹¹ After careful consideration of the power analysis and budget constraints, CSA decided on supplementing the wave 1 sample with 1,500 urban households.

The population frame for the urban expansion consists of all households in towns with population greater than 10,000 people. This population cut off of 10,000 people is the same threshold that is used to define small towns.¹² In addition to the existing sample of rural and small towns, this expansion means now that all households in Ethiopia have some positive probability of selection into the expanded ESS2 sample.¹³

In order to correspond with the existing, wave 1 design while ensuring that all urban areas are included, the population frame was stratified to ensure that the ESS will be able to provide population inferences for the same five domains as in ESS1 plus an additional domain for the city state of Addis Ababa.¹⁴ Specifically, the 6 strata are: Addis Ababa, Amhara, Oromiya, SNNP, Tigray, and “other regions” (including Dire Dawa). In those regions with the greatest urban populations, Addis Ababa and Oromiya, 20 EAs were selected; while in all other strata, 15 EAs were selected.

In an effort to improve efficiency, the frame was further stratified based on town size. While we did not have empirical evidence of important types of heterogeneity across big and medium cities, the assumption held was that big cities look quite different from medium cities and therefore stratification by size ensures coverage across these two types of urban areas. To this end, all strata except for the city state of Addis Ababa were stratified in medium-sized (population between 10,000 and 100,000) and big-sized (greater than 100,000) towns. Table 3.1 below provides the allocation of EAs in accord with the sample design for the wave 2 urban expansion.

¹⁰ The RSE for consumption is 5 percent in wave 1, based on rural and small towns combined and treating outliers with both a 1 percent and 2 percent symmetric trim.

¹¹ Under some assumptions, the required sample size was as low as 720 households.

¹² The CSA defines small towns based on population estimates from the 2007 Population Census; a town with the population of less than 10,000 is a small town.

¹³ There is an exception to this statement. The ESS and the AgSS surveys both exclude 9 zones from the population frame -- zones 2, 4, and 5 in the Afar Region and zones 3, 4, 5, 6, 7, and 8 in the Somali Region.

¹⁴ The city state of Dire Dawa already appears in the existing sample design.

Table 3.1: Urban expansion design, stratification, and allocation of EAs (n=1500)

Strata = Domains of Analysis	Sub- stratification By city size	EAs (prob. proportional to population)	Households (Systematic, Fixed-interval random)
Addis Ababa		20	300
Amhara	Big Medium	8 7	225
Oromiya	Big Medium	10 10	300
SNNP	Big Medium	8 7	225
Tigray	Big Medium	8 7	225
All other regions	Big Medium	8 7	225
Total		100	1500

Note: By design, 15 households per EA are selected. Medium is defined as a town with population between 10,000 and 100,000. Big is defined as a town with population greater than 100,000.

3.3 ESS Design Details, ESS1, ESS2 and ESS3

The ESS sample is a two-stage probability sample. The first stage of sampling entailed selecting enumeration areas (ie. the primary sampling units) using simple random sampling (SRS) from the sample of the AgSS enumeration areas (EAs). The AgSS EAs were selected based on probability proportional to size of population (PPS). For the rural sample, 290 EAs were selected from the AgSS EAs. For small town EAs, a total of 43 EAs were selected by PPS. Similarly, for ESS2 a total of 100 EAs were selected and added to the ESS1 sample. Table 3.2 shows how the EAs of the ESS1 (rural and small town EAs) and ESS2 (rural, small town, mid and large towns) are spread across regions of Ethiopia. ESS3 covered all those EAs covered by ESS2.

Table 3.2: First Stage Sample Design

	Total EAs	Rural EAs	Urban	
			Small town EAs	Mid and Large Town EAs
National	433	290	43	100
<i>Regions</i>				
Tigray	49	30	4	15
Afar	13	10	2	1
Amhara	86	61	10	15
Oromiya	85	55	10	20
Somali	26	20	3	3
Benishangul-Gumuz	11	10	1	0
SNNP	99	74	10	15
Gambela	12	10	1	1
Harari	14	10	1	3
Dire Dawa	18	10	1	7
Addis Ababa	20	NA	NA	20

The second stage of sampling was the selection of households to be interviewed in each EA. For rural EAs, a total of 12 households are sampled in each EA. Of these, 10 households were randomly selected (SRS) from the sample of 30 AgSS households. The AgSS households are households which are involved in farming or livestock activities. Another 2 households were randomly selected from all other households in the rural EA (those not involved in agriculture or livestock). In some EAs, there is only one or no such households, in which case, less than two non-agricultural households were surveyed and more agricultural households were interviewed instead so that the total number of households per EA remains the same.

In the small town EAs, 12 households are selected randomly (SRS) from the listing of each EA, with no stratification as to whether the household is engaged in agriculture/livestock. The final number of household interviewed in wave 1 was slightly less than the 3,996 as planned in the design. A total of 3,969 households were interviewed with a response rate of 99 percent. Of these 3,969 households in ESS1, ESS2 successfully re-interviewed 3,776 households. This implies a panel attrition rate of 5 percent, or successful follow-up rate of 95 percent. In ESS3 3,726 households were interviewed during the agriculture post planting visit (first visit of Wave 3). However, 27 households were not available for the second visit. Therefore, the total number of ESS1 households with complete interviews in ESS3 is 3,699. Out of the 27 that were not available in the second visit, 12 were in one enumeration area that could not be visited for security reasons. The remaining 15 were in different places and no respondent was available in the second visit.

As with the rural sample, the urban sample was selected following a multi-stage, clustered design. In the second stage of selection, 15 households were selected (SRS) in the mid- and large-size town EAs. Due to nonresponse and fieldwork issues, the final number of households interviewed was slightly less than the 1,500 urban households as planned in the design. A total of 1,486 households were interviewed with a response rate of 99 percent. During wave 3, 1255 households were re-interviewed yielding a response rate of 85 percent. Attrition in urban areas is 15% due to consent refusal and inability to trace the whereabouts of sample households. The original distribution of sample households in rural areas, small towns, and urban areas is shown in Table 3.3 along with the sample of original households re-interviewed in ESS3.

**Table 3.3: Distribution of Final Sample and actual households interviewed during wave 3
for ESS by Region and Zone in Rural and Urban areas**

Region Code	Region Name	Zone Code	Zone Name	Distribution of Sampled households						Distribution of Households interviewed during wave 3		
				Rural		Small towns (urban)		Mid- and large-sized towns (urban)		Rural	Small towns (urban)	Mid- and large-sized towns (urban)
				EA	HH	EA	HH	EA	HH	HH	HH	HH
1	Tigray	1	North Western	5	58	1	12	1	15	57	11	15
		2	Central	7	79	1	8	2	30	81	10	25

4. Training, Data Collection, Tracking & Monitoring

4.1 Training, ESS3

Six training sessions were held for the ESS3. These included: two training of trainers (TOT) (July 2015 and January 2016), two field staff (enumerator and supervisor) training sessions in August 2015 and January-February 2016, and two data entry training in October 2015 and March 2016. The TOT and the field staff training focused on the content of the questionnaires as well as practical applications in data collection and supervision. Data entry clerks were trained in Addis Ababa. All of the trainees had survey experience and most of them had participated in the first and second waves of the ESS.

The TOT sessions were held in Addis Ababa and were led by the LSMS-ISA team. The first TOT (in July 2015) lasted approximately two weeks, and the second TOT (in January 2016) took about one week.

The first field staff training was led by CSA experts together with the LSMS team. The first field staff training was held at three different locations: Bahirdar, Hawassa and Jimma¹⁶ and lasted approximately for three weeks in August 2015. The training sessions discussed post-planting and livestock questionnaires as well as new fieldwork management methods introduced in the second wave, such as concurrent data entry and household tracking. The second field staff training took place one location in Hawassa for about three weeks from January - February, 2016. The training discussed household, community, and post-harvest questionnaires for the entire sample.

4.2 Field Work Organization & Data Collection

The survey was designed to be implemented in two visits following the AgSS field schedule. For panel rural and small town households, the first visit took place between September and October 2015. In this visit, the post-planting agriculture and livestock questionnaires were administered. Crop cut was conducted between September to December 2015. The second visit took place between February and April 2016 when the household, community and post-harvest agriculture questionnaires were administered.

For the Urban households that are added during the second wave, all questionnaires were administered in one visit that took place between February and April 2016.

Table 4.1: Implementation Timeline

ESS Questionnaire	2015				2016		
	Sep	Oct	Nov	Dec	Feb	Mar	Apr
Post-planting agriculture and Livestock questionnaires							
Crop Cut							
Household, Community, and Post-harvest agriculture questionnaire							
All modules in large town EAs							

¹⁶ Those who had taken the training in Adama in August went to Hawassa for the January training.

Note: The agriculture and livestock questionnaires were implemented differently in urban areas (small and medium/large towns) than in rural areas. For medium and large urban households, only the livestock questionnaire was administered. For small towns both agriculture questionnaires including post planting and post-harvest as well as the livestock questionnaire were administered. Agriculture interviews for small town areas didn't include crop-cut and land measurement by the enumerator and thus only include self-reported estimates.

The post-planting and post-harvest questionnaires collected information on the same fields and crops in two different visits.¹⁷ While the post-planting questionnaire collected field and crop level information such as area measurement, inputs, and other farming practices, the post-harvest questionnaire captured harvest, harvest inputs, crop damage, and utilization.

The specific section on harvest amount (Section 9) which includes crop cutting and self-reported harvest for crops by field (excluding tree/root/permanent crops) was fielded with either the post-planting and post-harvest agriculture questionnaires – depending on the timing of the harvest for that crop/field. For some crops, in some places, crop cutting started earlier than the date of the scheduled post-harvest round. Therefore, enumerators captured the crop cutting data while conducting the post-planting questionnaire because it needed to be done when the farmer actually harvests the crop. In those households where the crop cutting information was collected during the post-planting round, harvest information was collected during the post-harvest round and collection of crop cutting information was not repeated.

Most of the questions in the post-planting, post-harvest and livestock questionnaires were asked of the holder (Table 2.3-2.5). However, some questions were directly measured by the enumerator as per the specific instructions given in the questionnaires and field manuals. In the post-planting questionnaire, the enumerator measured all the fields (sub-parcels) managed by the holder using GPS or, if the field was small (less than or equal to 40 Square meter), the measurement was made both by compass and rope as well as GPS¹⁸.

The enumerator also conducted the crop cutting and completed all the applicable questions in the crop cutting section. Crop cut was conducted on all cereals, pulses, and oilseeds (23 crops). In each sampled EA field workers have conducted 4 meter by 4 meter crop cut on 10 fields of eligible crop cut crops. For detail crop cut procedure please refer to the crop cut manual.

Similarly, questions in the household questionnaire were collected from the most knowledgeable person. For individual-level sections, the information was collected from each individual, except for children, in which case the information was collected from a parent or knowledgeable adult in the household (see Table 2.1). The enumerator conducted the anthropometric measurements for children 6-83 months.

¹⁷ Since post-planting and post-harvest information was collected in two different visits for panel households, there are approximately 200 plots with PP data but no PH data. These cases include households that moved away or passed away between visits, those plots that contained permanent fruits or tree crops not harvested during the year, and plots that were used for other purposes excluding cultivation.

¹⁸ GPS estimates become less accurate for smaller fields; in these cases, enumerators were instructed to use rope and compass to measure the area.

The community questionnaire was collected from focus groups of community informants and through direct observation (Table 2.2). This questionnaire was administered by the field supervisors, rather than the enumerators. The group of community informants in each EA was formed based on the instructions in the community questionnaire and the manual. The community questionnaire also collected commodity price information from up to two nearby markets. The price data were collected with the help of sellers in the market centers. For the community questionnaire data was collected using paper questionnaire in rural and small town EAs but CAPI (Survey Solutions) was used in medium and large town EAs.

Resident enumerators were used to administer the household, agriculture (post-planting and post-harvest), and livestock questionnaires in rural and small-town EAs. The CSA assigned one resident enumerator for each of these EAs. The enumerator lived in the EA for the entire survey period from September 2015 to May 2016. Daily laborers/ field guides were also hired locally for a few days to assist the enumerators in parcel/ field measurement and crop cutting activities. They also helped when child anthropometrics were taken. Temporary mobile enumerator teams were used for the mid- and large-size town EAs.

One field supervisor was assigned to supervise the work of three enumerators in three EAs. As mentioned above, the field supervisors also administered community questionnaires in their respective three EAs.

4.3 Tracking of Panel Households

During the third wave, some of the households interviewed during the first wave and second were not found in their original location. Most of those who were in the country were tracked and interviewed.

The tracking protocol was as follows. If any member of the original household was found in the original dwelling, they were interviewed. If no household member from wave 1 or wave 2 was found in the dwelling, the household was tracked if it moved to a different location within the country. The household was not tracked if it left Ethiopia. If a household split, the part of the household that contained the wave 2 head of household was tracked. Table 4.2 presents the tracking information for households included in wave 1.

4.4 Fieldwork Monitoring and Evaluation

Routine supervision by CSA's field supervisors entailed the field-level coordination by all CSA branch offices. Branch level statisticians and supervisors who were assigned to this project conducted the routine supervision. The branch supervisors made three extended visits to the EAs between September, 2015 and April, 2016. As noted above, one field supervisor checked the work of three enumerators in three EAs. The last visit was combined with community interviews that were conducted by the supervisors themselves. Up to two branch statisticians were also in the field to check the work of the supervisors and enumerators.

Additional supervision was conducted by CSA head office experts and Bank staff and consultants. The teams' first visit was held in September-December 2015 when interviews with

the Post-planting, crop-cut and livestock questionnaires were being conducted. The second visit was in February-April 2016 when the household, community, and post-harvest agriculture data were being collected.

Table 4.2: Status of panel households

Location Status	Households	Interviewed	Not interviewed
Same Dwelling	4,388	4,345	43
Moved	1071	636	435
<i>Within same Kebele</i>	397	384	13
<i>Nearby Kebele</i>	129	111	18
<i>Not nearby Kebele, but within same Woreda</i>	50	43	7
<i>Outside Woreda, within same Region</i>	85	55	30
<i>Outside of Region</i>	50	12	38
<i>Other</i>	360	31	329
Total	5,459	4,981¹⁹	478

¹⁹ The total number of household questionnaire completed is 4954 because 27 households were migrated after the post planting interview. Therefore, the total number of households interviewed during the post planting season was 4981 households but only 4954 households were interviewed during the post-harvest visit.

5. Data Management and Description of Datasets

5.1 Data Management

5.1.1 Concurrent Data Entry

The completed paper questionnaires were keyed in the branch offices. The CSPro software was used to design the data entry programs. Following the approach used in wave 2, a near-concurrent data entry arrangement was employed. In this arrangement, completed questionnaires were sent to the branch offices for entry. Then the data files were checked by a Stata program for errors. The questionnaires were then sent back to the field for correction. This process of parallel data collection and entry continued throughout until the fieldwork was completed.

5.1.3 Final Data Cleaning

Final data cleaning was carried out on all data files. Only errors that could be clearly and confidently fixed by the team were corrected; errors that had no clear fix were left in the datasets. Cleaning methods for these errors are left up to the data user.

5.1.4 Weighting of Data

The ESS3 data needs to be weighted to represent the national-level population of rural, small and large town households. A sample weight with post-stratification adjustments was calculated for the households and this weight variable is included in all the datasets.²⁰ It reflects the adjusted probability of selecting the household into the sample. The inverse of this weight can be considered an expansion factor that sums to the total population of households in the nation. When this weight is used in a household-level file, it sums to the population of households. When this weight is used in an individual-level file, it sums to the population of individuals. If the data user wishes to produce an estimate for the population of individuals in a household-level file, an approximate expansion factor is the sample weight times the household size of each household.

The ESS3 sample weights were calculated in two stages. In the first stage, weights were separately calculated or adjusted for the three different sampling frames (rural, small town, and large town²¹). For the rural and small town sample, the wave 1 weights were adjusted to account for relisting, non-response, and attrition of households in the sample frame between the two waves (wave 1 and wave 3). In each of the waves, the rural and small town EAs were re-listed

²⁰ The small town weights for wave 1 were adjusted in September 2016 in response to new information received on the sampling frame. As a result, to ensure the sum of weights equals the population of Ethiopia, all wave 2 weights were subsequently adjusted accordingly as well. All data users who downloaded Wave 2 data prior to September 2016 are advised to re-download the data for the updated weights.

²¹ Large town in this case refers to the urban supplement of mid- and large-sized towns, all towns greater than a population of 10,000.

which reflects EA-specific population growth patterns. The post-stratification adjustment accounts for this change

Similarly for the mid- and large-town sample, the wave 1 weights were adjusted to account for relisting, non-response, and attrition of households in the sample frame between the two waves (wave 2 and wave 3). In each of the waves, the mid- and large-town EAs were re-listed which reflects EA-specific population growth patterns. The post-stratification adjustment accounts for this change

5.2 Description of Public Datasets

The electronic datasets are organized by questionnaire with the following labels on file names in parentheses: household (*hh*), community (*com*), post-planting agriculture (*pp*), post-harvest agriculture (*ph*), and livestock (*ls*). The data within each questionnaire do not contain any constructed variables. For example, the ESS data provide most all variables needed to construct an estimate of total household consumption, but the data set does not contain an estimated value of total consumption. The only compiled data that are included with the ESS files are the geo-spatial variables described below.

Within each questionnaire type, the data file naming scheme is a combination of the prefix '*sect*', followed by section number, and then followed by suffix '*hh_w3*' for household wave 3 data, and '*com_w3*' for community wave 3 data. Similarly, the suffixes for post planting and post-harvest as well as livestock wave 3 data are '*pp_w3*', '*ph_w3*', and '*ls_w3*' respectively.

For example, the data set that corresponds with the section 1 of the household questionnaire is in the data file '*sect1_hh_w3*'. The exception to this rule are sections where the files are broken down even further due to different reference period or different levels of recording the data. An example is section 5 of the household questionnaire on consumption where the section is split into 4 files with each file corresponding to the reference period collected in the section. In this case, the name of the corresponding files will be '*sect5a_hh_w3*', '*sect5b_hh_w3*', '*sect5c1_hh_w3*' and '*sect5c2_hh_w3*'.

Each dataset has identification variables, a rural area/small town/large town indicator variable (*rural*), and sampling weight (*pw_w3*).

For purposes of maintaining the confidentiality of the data all names and addresses including contact addresses and field descriptions in the post planting agriculture questionnaire, as well as names of field and data entry staff, have been removed from the datasets. In addition, the GPS coordinates have also been removed as these could be used to locate households and fields with accuracy. However, as a courtesy to users, a set of geo variables are provided with the data as described in Appendix 1.

5.2.1 Household Data Files

The household data are organized in 25 data files (Table 5.1).

Table 5.1: Household Data Files

Section	Section Name/ Content	Dataset Filename	Unique identification variables
Cover	Cover	<i>sect_cover_hh_w3</i>	<i>household_id2</i>

Note: Livestock data files are new to this wave. The data are not directly comparable to previous rounds (ESS1 and ESS2)

5.2.4 Geospatial Data

The ESS data files also include additional geospatial data computed for data users. The geovariabes are stored in two data files: field-level data (Pub_ETH_PlotGeovariabes_Y3), and household-level data (Pub_ETH_HouseholdGeovariabes_Y3). Information on the ESS geospatial data is presented in Appendix 1.

5.2.5 Conversion factors for food and crop local units

The list of units for both food consumption and crop production quantities was greatly expanded in ESS3. As a result, some food and crop quantities are often reported in non-standard units in the data. In order to convert from non-standard units to the more widely understood standard units (kilograms and liters), two sets of conversion factor files are included with the data. The first is ***Food_CF_Wave3.dta*** which contains the conversion factors for food quantities in the food consumption file. The second is the dataset ***Crop_CF_Wave3.dta*** which contains conversion factors for crops to be used with the agricultural module. For more information on these files and how to use them with the data, see Section 6.4.

5.2.6 Land area conversion factors for local units

The agricultural questionnaire collects land size as reported by holders, in addition to GPS-device measures of field size. As a courtesy to data users, a set of conversion factors for local units have been compiled from several sources. The data file (ET_local_unit_area_conversion) is provided with the ESS data to facilitate converting non-standard units into square meters. The ESS data provide both standard unit measures of land (from GPS and/or rope and compass

measures) and self-reported values which may be reported in local units. The included conversion factors have not been used to convert self-reported land values into standard unit measures. The provision of these conversion factors should not be interpreted as an endorsement of these factors by the CSA or the LSMS-ISA team. Neither the CSA nor the LSMS-ISA has validated these conversion factors under the ESS program. The conversion factors were sourced primarily from a report completed by the CSA²³ and a study on land certification in Ethiopia²⁴, and supplemented by other internal CSA sources.

6. Using the ESS Public Data

6.1 File Structure

The data should always be used in conjunction with the questionnaire and the interviewer's instruction manuals. The files are organized following the questionnaire structure. A file is a section or a sub-section in the questionnaire. In addition, there are three files: two for geovariables and another one for quantity (consumption and production) conversion factors. All the variables in the geovariable files are constructed based on the GPS coordinates collected at the homesteads and plots. The conversion factor data is new for this round.

6.2 Merging Datasets

6.2.1 Within wave 3

All households are uniquely identified by the variable *household_id2* in the household and agriculture data. This variable is used as the unique key variable in the merging of all household-level data files. In some datasets, where there is more than one observation per household, additional key variables may be required. In the case of individual level files, the variable that uniquely identifies the individual within the household is *individual_id2*. So in order to merge any two individual type files, the variable *individual_id2* would be used. In the agriculture datasets, parcel files are merged using *holder_id* and *parcel_id* while crop files are merged using *holder_id*, *parcel_id*, *field_id*, and *crop_code*.

The community questionnaire is administered at the EA level. A unique EA identifier, *ea_id2*, is in every data file. This variable is the concatenation of the variables *region*, *zone*, *wereda*, *town*, *subcity*, *kebele* and *EA*, and is used as the unique key variable in the merging of all community-level data files. In some of the community datasets, additional key variables may be needed.

Due to the sequence in which the ESS visits occur (see Table 4.1), there were 27 households which were administered the post-planting and/or livestock questionnaires but were not administered the household and post-harvest questionnaires. These 27 households could not be located during the subsequent household visit but the agriculture questionnaire is included in our sample even though these household have missing post-harvest and household questionnaires.

6.2.2 Between Wave 1, Wave 2 and Wave 3

In order to merge datasets between wave 1 and either wave 2 or wave 3 (note: this is only possible for rural and small town households), you will need to use different variables from those mentioned above. To merge household-level data in wave1 you should use the variable *household_id*. The variable *household_id* is carried over from wave 1 and thus is empty for urban households as they were not included in wave 1. The variable *ea_id* is also carried over from wave 1 and is empty for all urban EAs. *ea_id* can be used to merge wave 1 community data with wave 2 or wave 3 community data (for EAs included in both waves).

In order to merge only Wave 2 and Wave 3, use *household_id2*.

6.3 Network Roster

A network roster is included in the post-planting and post-harvest agriculture questionnaires. The network roster keeps a record of the list of places/persons (businesses, markets, friends, etc.) with which the agricultural holder engages in agricultural trading activities. Each person/place is assigned the network code of the line in which it is in that section and is recorded only once so we have for example, network codes N01, N02 etc. which are just a serialization of the persons/places in the holder's network. An entry in the network roster is similar to an individual in the household roster where an individual acquires the individual code of the line in which the person's name and its relationship to the household head and other individual level identifiers/variables are recorded. Likewise, in the network roster, the N01, N02, N03 etc. are IDs. Other two variables recorded in the network roster are codes for the type of the network (relative, friend, neighbor, government agency, etc.,) and code for the location of the person/place.

6.4 Unit Conversion Factors

The expanded list of units used in ESS3 required additional conversion factors not previously available to convert these non-standard units into a common standard unit (kilograms or liters). In order to collect the item-unit weights required to calculate conversion factors, a specialized market survey was implemented prior to commencement of ESS3. Reference photographs were also taken for all item-unit weights collected. The market survey was conducted in markets throughout Ethiopia in an effort to capture variations in conversion factors throughout the country.

A wide array of item-unit weights was collected in this survey and were then used to calculate conversion factors. The calculated conversion factors are contained in ***Food_CF_Wave3.dta*** and ***Crop_CF_Wave3.dta*** included in the ESS3 data. In both files, there are separate variables which have region-specific conversion factors (e.g. *mean_cfl* for Tigray). There is also a national conversion factor (*mean_cf_nat*). Where conversion factors were acquired for a particular region, the average conversion was included for the region. However, if there was no conversion found in a region, the national average was used for the region-specific conversion variables. Although these conversion factors cover a majority of item/crop-unit combinations observed in the data set, there are still some gaps where conversion factors are not available. There is an ongoing effort to fill these gaps and updated conversion factors will be released as they become available.

In order to use the conversion factors, one has to multiply a crop or food item quantity with a conversion factor. In order to do this, the relevant data set must be merged with the conversion factors data set. For example, the dataset ***sect5a_hh_w3.dta*** features question 2, which asks how much the household consumed of each food item. One household is said to have consumed 1.5 large medeb of onions. In order to convert “large medeb” to kg, the dataset ***Food_CF_Wave3.dta*** has to be merged on the item code (*item_cd_cf*²⁵) and unit code (in this

²⁵ This variable (*item_cd_cf*) was specifically created to merge with the conversion factor files. This was necessary to account for the “other” categories where specific items were listed. For example, a common “other vegetable” reported was carrot. There is no applicable code for carrot in *item_cd* but a code was assigned in *item_cd_cf*

case, *hh_s5aq02_b*), and then the quantity (1.5 in this example) is multiplied with the relevant conversion factor. This could either be the conversion factor for that household's particular region/strata (variable *mean_cf4* for Oromia) or the national conversion factor (variable *mean_cf_nat*). The same procedure can be followed to convert crop quantities using *Crop_CF_Wave3.dta* by merging on crop code (*crop_code*) and unit code (*ph_s9q04_b* in *sect9_ph_w3.dta* for example).

These conversion factors are specific for the format of the ESS3 data. Separate food conversion factors for ESS2 and ESS1 are also being released. These conversion factors will be based upon the ESS3 conversion factors but modified to conform to the format that the ESS2 and ESS1 data was collected. See the revised BIDs for ESS1 and ESS2 for more details on the other conversion factors.

6.4.1 Reference Photo Album

Beginning in ESS3, reference photographs were used in the collection of food consumption and crop production quantities reported in non-standard units. The photographs depict food items or crops in non-standard units (and different sizes where applicable) and were meant to ensure uniformity in the non-standard unit amounts across respondents. The photos were collected in a systematic manner during the market survey where the item-unit weights were also collected. During the market survey, interviewers were instructed to follow strict protocols when taking the photographs such as including a reference object (typically a standard sized bottle of water) to provide the respondent with a frame of reference for the size of the unit. For units with multiple sizes, all of the relevant sizes were taken in the same photo for easier comparison by the respondent. The reference photos taken during the market survey were compiled into an album that was printed and provided to all interviewers. Item-specific photos were included for non-container units (e.g. piece, medeb, bunch) while only one photo of containers (e.g. tassa, kunna, jog) were included. The reference photo album that was used by interviewers is included with the additional documentation on the website (see "Photo Aids") The procedures used for collection of the reference photos as well as the conversion factors followed the guidelines laid out in a forthcoming guidebook produced by the LSMS team, *The Use of Non-Standard Units for the Collection of Food Quantity: A Guidebook for Improving the Measurement of Food Consumption and Agricultural Production in Living Standards Surveys*.

specifically for the purposes of merging with *Food_CF_Wave3*. The codes for these "other" items are not listed on the questionnaire.

7. Overall Problems and Challenges Faced During the Second Wave of the Survey and Recommendations for the Third Wave of the Survey

Designing and implementing a complex survey such as the ESS presents various challenges. In this section we outline some key issues that arose, lessons learned and make recommendations for the next wave of the survey.

7.1 Survey Instruments

During the preparation of the third wave survey the team gathered feedback from data users in Ethiopia and beyond. Most of the feedback was on additional questions. There were also suggestions for modifying some questions. Most of the inputs were incorporated and reflected in the questionnaires. This however, required revising the entire format of the modules as well as the data entry programs.

7.2 Fieldwork

ESS enumerators in rural areas were also responsible for conducting AgSS interviews in their respective EAs. This was an added burden as the enumerators had to measure fields, conduct crop cuts and carryout interviews. This contributed to the delay of the fieldwork in these areas.

Due to the large-scale nature of this survey, there are sometimes mistakes made during the interviewing process. The following points highlight such errors in the data:

- HH Section 1: There were approximately 430 panel individuals where the sex listed in wave 1 was different from the sex listed in wave 2. Due to the gender ambiguity of some names in Ethiopia, the team was only able to correct 77 such cases with 100% certainty. Therefore, the data user will find approximately 350 individuals where the sex between waves does not match.

- PP Section 5, PH Sections 11 and 12: The information for these sections is collected at the level of the holder/crop/seed type. However, in the case of approximately 200 holders, the enumerator mistakenly collected the information at the level of the holder/**parcel/field**/crop/seed type for PP section 5 and holder/**parcel/field**/crop for PH sections 11 and 12. Therefore there are approximately 800 cases in PP section 5, 170 cases in PH Section 11, and 300 cases in PH Section 12 that are not uniquely identified by holder/crop(/seed type). The data for these observations can be aggregated by the data users as they see fit.

- Due to confusion in the data collection process, there are two households that have post-harvest data but do not have post-planting data. Thus there are three plots that can be found in PH sections 9 and 10, but not in PP section 4.

7.3 Tracking

Coordinating with different branch offices to trace those households who had moved to other regions required additional resources and field organization. Some households could not be tracked due to lack of information about their new location. The contact information collected during the first wave was either inaccurate or not enough to trace the locations. Neighbors and community leaders in the original EAs did not have the information.

7.4 Decentralized Data Entry

The third wave employed decentralized data entry arrangement; the questionnaires were keyed in the field to facilitate the concurrent data entry arrangement. While this facilitated error correction in the field it also created a challenge on troubleshooting problems in terms of lower-quality technical infrastructure (eg. computers) in the field offices and also more logistical challenges in terms of fixing errors in the data entry programs in each office rather than centrally. The LSMS team made frequent travels to the branch offices to work with the data entry clerks in the field. Another major challenge in the field-based data entry was frequent power interruption. In some places the power outages lasted for several days.

Appendix 1: Geospatial Data with the ESS

The ESS collects confidential information on respondents. The confidential variables pertain to (i) names of the respondents to the household and community questionnaires, (ii) village and constituency names, (iii) descriptions of household dwelling and agricultural field locations, (iv) phone numbers of household members and their reference contacts, (v) GPS-based dwelling and agricultural field locations, (vi) names of the children of the head/spouse living elsewhere, (vii) names of the deceased household members, (viii) names of individuals listed in the network roster, and (ix) names of field staff. To maintain confidentiality, this information is not included in the ESS public use data.

To increase the use of the ESS data, a set of geospatial variables has been provided by using the geo-referenced field and dwelling locations in conjunction with various spatial databases that were available to the survey team. These include measures of distance, climatology, soil and terrain, and other environmental factors. Time-series on rainfall and vegetation have also been used to describe the survey agricultural season relative to normal conditions. These variables are intended to provide some understanding of how geophysical characteristics vary at the landscape level. The two tables below provide the name, type, source, reference period, resolution, description, and source of each variable. All geospatial variables have been produced using the unmodified GPS data.

Pub_ETH_PlotGeovariables_Y3

The field-level geo file *Pub_ETH_PlotGeovariables_Y3* contains four geospatial variables measuring field distance to household, slope, elevation and potential wetness index for field locations. The observations are uniquely identified by the combination of *holder_id*, *household_id*, *parcel_id* and *field_id*. The observations included in this file are fields that are owned and/or cultivated by the household and that have been visited for GPS-based land-area measurement.

Pub_ETH_HouseholdGeovariables_Y3

The household-level geo file *Pub_ETH_HouseholdGeovariables_Y3* contains a range of variables measuring (on the basis of the household dwelling) distance to main points, climatology, landscape typology, soil and terrain, and crop season parameters. The observations are uniquely identified by the ESS household id.

To partially satisfy user interest in geo-referenced location, while preserving the confidentiality of sample household and communities, modified EA-level coordinates are provided as part of the household geovariable table. Modified coordinates are generated by applying a random offset within a specified range to the average EA value (following the MeasureDHS approach). For households that have moved between waves 1 and 3, and are more than 5 km from their baseline location, the offset is with respect to the new household location.

More specifically, the coordinate modification strategy relies on random offset of EA center-point coordinates (or average of household GPS locations by EA in ESS) within a specified range determined by the urban and rural classification. For small towns and urban areas, an offset range of 0-2 km is used. In rural areas, where communities are more dispersed and risk of

disclosure may be higher, a range of 0-5 km offset is used. Additionally, an offset range of 0-10 km is applied to 1% of EAs, effectively increasing the known range for all points to 10 km while introducing only a small amount of noise. Offset points are constrained at the zone level, so that they still fall within the correct zone for spatial joins, or point-in-polygon overlays. The result is a set of coordinates, representative at the EA level, that fall within known limits of accuracy. Users should take into account the offset range when considering different types of spatial analysis or queries with the data. Analysis of the spatial relationships between locations in close proximity would not be reliable. However, spatial queries using medium or low resolution datasets should be minimally affected by the offsets.

Appendix 2: How to Obtain Copies of the Data

The data are available through the CSA web site:

<http://www.csa.gov.et/>

or through the LSMS website:

<http://www.worldbank.org/lms>

Users do not need to obtain the permission of the CSA to receive a copy of the data, but will be asked to fill in a data access agreement. In this agreement, users agree to: (a) cite the Central Statistical Agency of Ethiopia as the collector of the data in all reports, publications and presentations; (b) provide copies of all reports publications and presentation to the Central Statistical Agency (see address below) and the Poverty and Inequality Division of the World Bank (see address below); and (c) not pass the data to any third parties for any reasons.
