Sampling

Sampling Procedure

The sample consists of 1,500 households with 7,005 individuals, stratified at the Oblast (region) and Urban/Rural level. The sample is grouped into 75 PSUs of 20 households each. Each PSU is randomly selected with a probability proportional to its size. Within each PSU, the households are selected using a geographical sampling procedure. 4 random point wrre generated using a numbered grid over a map. From this starting point within the PSU, one out of every 4 households is interviewed, following a systematic route.

Within each household, two sections of the questionnaire were directed at two different categories of individuals. Sometimes, the same person responded to both sections. First, the most knowledgeable person of the household was asked the main part of the questionnaire. The second part of the questionnaire was asked to a randomly chosen adult between the age of 15 to 64 who is not currently a migrant, using a random number table (Kish grid) to ensure the randomness of the selection. Provided it was not possible to reach the person selected after 3 attempts, another person was selected using the same random procedure.

The second part of the questionnaire included detailed modules about labour and work expectations, migration and preparation for migration, language skills, and technical skill training. It also included a self-assessment of technical skills and knowledge, a non-cognitive, and a cognitive test. Unfortunately, the 7 language questions of the cognitive skills test are unusable because of translation.
