

Congo, Dem. Rep. - Health Results Based Financing Impact Evaluation 2015, Household Baseline Survey

Gil Shapira - World Bank, DECHD, Gunther Fink - Harvard University

Report generated on: April 18, 2017

Visit our data catalog at: <http://microdata.worldbank.org>

Sampling

Sampling Procedure

Only one village or urban area was selected for each selected health area. The probability of being selected was the same for all villages in the health area. The remaining villages were ordered randomly so that a replacement could be made if the village originally selected was not accessible. The field teams were asked to list all households in the selected villages in order to identify those with a female member aged 15 to 49 who had waited for a child in the two years preceding the survey. On the list of all households that met the eligibility criteria, field teams had to select 10 households randomly, with all eligible households within the same village having all the same chances of being selected.

Since the primary objective of the household survey is reproductive and maternal health, individual interviews were conducted with all available female members of the household who had become pregnant in the two years prior to the survey. Data were also collected on all children under five years of the women interviewed.

A total of 6,596 households in the 14 SDAs were randomly selected for the purpose of the baseline survey.

Weighting

Weighting information is provided in section 2 of the survey report.

Questionnaires

Overview

The household questionnaire included general questions about the interaction of households with the health care system and health expenditure. It is provided under the Related Materials tab.

Data Collection

Data Collection Dates
