# Sampling

## Sampling Procedure

---

The sample design for the VOCS 2014-2015 used a master sample (MS) originally designed for the Quarterly Labour Force Survey (QLFS) as a sampling frame. The MS is based on information collected during the 2001 Population Census conducted by Stats SA. The MS has been developed as a general-purpose household survey frame that can be used by all household-based surveys irrespective of the sample size requirement of the survey. The VOCS 2014/15, like all other household-based surveys, uses an MS of primary sampling units (PSUs) which comprise census enumeration areas (EAs) that are drawn from across the country.

The sample for the VOCS 2014/15 used a stratified two-stage design with probability-proportional-to-size (PPS) sampling of PSUs in the first stage, and sampling of dwelling units (DUs) with systematic sampling in the second stage. The sample was designed to be representative at provincial level. A self-weighting design at provincial level was used and MS stratification was divided into two levels. Primary stratification was defined by metropolitan and non-metropolitan geographic area type. During secondary stratification, the Census 2001 data were summarised at PSU level. The following variables were used for secondary stratification: household size, education, occupancy status, gender, industry and income. The Master Sample is based on 3 080 PSUs.

A Probability Proportional to Size (PPS) systematic sample of PSUs was drawn in each stratum, with the measure of size being the number of households in the PSU. The sample size for the VOCS 2014/15 had approximately 30 000 dwelling units from 3 080 PSUs. In each selected PSU, a systematic sample of dwelling units was drawn. The number of DUs selected per PSU varies from PSU to PSU and depends on the Inverse Sampling Ratios (ISR) of each PSU and the number of dwelling units in that PSU.

## Weighting

---

### Sampling weights

The sampling weights for the data collected from the sampled households are constructed in such a manner that the responses could be properly expanded to represent the entire South African households.

The base weight for each sampled household is equal to the reciprocal of the probability of selection, which is simply the inverse of the sampling rate. The sampling rate has been assigned at province level, i.e. all design strata within a province have been sampled at the same rate. Thus, the initial base weight (or design weight) assigned to each household in a province is simply the inverse sampling rate (ISR) for the province. The first adjustment was applied to account for informal and/or growth PSUs. The second adjustment was applied to account for the EAs with less than 25 households, and the third was the non-response adjustment. In addition, there were two types of non-response adjustments: PSU non-response adjustment and household non-response adjustment. In general, the non-response adjustment will be applied at the PSU level. Only in those cases where the non-response at the PSU level is too large, the non-response adjustment will be applied at the stratum level.

### Final survey weights

The final survey weights were constructed by calibrating the non-response-adjusted design weights to the known population estimates as control totals using the 'Integrated Household Weighting' method. The lower bound for the calibrated weights was set equal to 50 when computing the calibrated weights with the StatMx software (Statistics Canada software). The VOCS 2014/15 sample was calibrated using the Population Estimate of Mid May 2014. The final weights were benchmarked to the known population estimates of 5-year age groups by population groups by gender at national level, and broad age groups at province level. The calibrated weights are constructed such that all persons in a household would have the same final weight. Records for which the age, population group or gender had item non-response could not be weighted and were therefore excluded from the dataset. No additional imputation was done to retain these records.

# Questionnaires

## Overview

---

The VOCS 2014/15 questionnaire was based on the questionnaires used in the International Crime Victim Survey (ICVS) and previous VOCSSs conducted by the Institute for Security Studies (ISS) and Statistics SA.

Sections 10 to 20 of the questionnaire relate to household crimes. A proxy respondent (preferably head of the household or acting head of household) answered on behalf of the household. Section 21 to 28 of the questionnaire about crimes on individuals were asked of a household member who was selected using the birthday section method. This methodology selects an individual who is 16 years or older, whose birthday is soonest after the survey date.

# Data Appraisal

## Other forms of Data Appraisal

### Comparability:

Prior to 2014/15, VOCS respondents were asked about their crime-related experiences in the previous calendar year, but the VOCS changed to a Continuous Data Collection (CDC) method. In this data collection method, respondents were interviewed on a rolling basis over the course of a year and asked about crime experienced in the 12 months prior to the interview. As a result of this, the victimisation experiences reported by respondents interviewed in a period of 12 months relate to a broader span of 23 months.

The VOCS 2014/15 is comparable to the previous VOCSs in that several questions have remained unchanged over time. Where possible, it was generally indicated in the report.
