Sampling

Sampling Procedure

La muestra de la ENSMI-98/99 es una submuestra del marco muestral del Censo Poblacional de 1994. Dado el tiempo transcurrido entre el levantamiento censal y la fecha de ejecución de la encuesta, se hizo una actualización completa, entre septiembre y diciembre de 1998 en el 100 por ciento de los sectores muestrales seleccionados.

La descripción de la muestra y el procedimiento de selección figuran en el Apéndice A del informe final.

Response Rate

Total que cubrió la ENSMI-98/99 fue de 6,652 hogares, y de 6,756 mujeres elegibles. La tasa de respuesta en las mujeres elegibles a nivel nacional fue de 89 por ciento (91 por ciento en el área rural y 85 por ciento en el área urbana). En total, se obtuvo información para 5,587 hogares, 6,021 mujeres de 15 a 49 años y 4,545 niños menores de cinco años.

Questionnaires

Overview

En la ENSMI-98/99 se utilizaron dos cuestionarios a nivel de todos los departamentos (uno de hogar y otro para mujeres) y uno específico sobre migración y uso de recursos naturales para el departamento del Petén. El primer cuestionario que se aplica es el de hogar, el cual permite la identificación de todas las mujeres elegibles. El segundo cuestionario utilizado es el dirigido a las mujeres elegibles (de 15 a 49 años), en donde se recolecta la información fundamental de las condiciones de salud materno infantil.

DATA COLLECTION NOTES

Capacitacin

El proceso de capacitacin del personal de campo y de nivel central se dividi en dos cursos de cuatro semanas cada uno. El primero se efectu en la ciudad capital y el segundo en Alta Verapaz. Durante los cursos de capacitacin fueron aplicados 1,200 cuestionarios, en comunidades no incluidas en el marco muestral, ubicadas en los departamentos de Sacatepequez, Chimaltenango, Solol, Alta Verapaz, Santa Posa, El Progreso y Guatemala.

La capacitacin fue dirigida inicialmente a supervisoras, se prosigui con las encuestadoras, y finalmente al personal de edicin central y digitacin. Para cada uno de estos recursos capacitados se cont con su respectivo manual, que incluye todo lo relacionado con el llenado correcto del cuestionario y sus funciones especficas.

Recoleccin de Informacin

El periodo de recoleccin de datos o trabajo de campo se inici el 18 de noviembre de 1998, y se concluy el 2 de mayo de 1999. La tormenta tropical que afect en el mes de noviembre de 1998 a Guatemala, trastorn seriamente la recoleccin de datos, principalmente por las condiciones de las vas de acceso. La recoleccin de datos se inici con tres equipos de trabajo en la ciudad capital, Nor Oriente y la costa sur del pas. Posteriormente se incorporaron tres equipos con el idioma kekchi como idioma materno.

Data Processing

Data Editing

The staff selected for typing the questionnaires participated during most of the questionnaire filling training and was subsequently trained in aspects directly related to the typing process. Typing questionnaires began five days after the fieldwork began. The ENSMI-98/99 data processing comprises the central reception, criteria and coding, fingering and verification stages (for 100 percent of the questionnaires), recording and cleaning of non-consistency. These tasks were carried out by eight people. All information processing was performed using standard procedures under the DHS program and with the ISSA Interactive Package (Integrated System for Surveys Analysis) in networked personal computers.

Data Appraisal

Estimates of Sampling Error

Por tratarse de una encuesta por muestreo, los resultados de la ENSMI 98/99 que se incluyen en el presente informe son estimaciones que estn afectadas por dos tipos de errores: aquellos que se producen durante las labores de recoleccin y procesamiento de la informacin (que se denominan usualmente errores no muestrales) y los llamados errores de muestreo, que resultan del hecho de haberse entrevistado slo una muestra y no la poblacin total. El primer tipo de error incluye la imposibilidad de entrevistar a todas las mujeres seleccionadas, errores en la formulacin de las preguntas y en el registro de las respuestas, confusin o incapacidad de las mujeres para dar la informacin y errores de codificacin o de procesamiento. Al igual que para las encuestas anteriores de 1987 y 1995, para la ENSMI-98/99 se trat de reducir a un mnimo este tipo de errores a travs de una serie de procedimientos que se emplean en toda encuesta bien diseada y ejecutada, como son: el diseo cuidadoso y prueba del cuestionario, intensa capacitacin de las entrevistadoras, supervisin intensa y permanente del trabajo de campo, revisin de los cuestionarios en el campo por parte de las editoras, supervisin apropiada en la etapa de codificacin, y procesamiento de los datos y limpieza cuidadosa del archivo con retroalimentacin a las supervisoras, editoras y entrevistadoras a partir de cuadros especficamente preparados para control de la calidad de la informacin. Los elementos de juicio disponibles sealan que este tipo de errores se mantuvo dentro de mrgenes razonables en la ENSMI-98/99. En 10 que sigue no se har ms referencia a los errores ajenos al muestreo sino nicamente a los llamados errores de muestreo.

La muestra de hogares visitados para la ENSMI-98/99 no es sino una de la gran cantidad de muestras del mismo tamao que sera posible seleccionar de la poblacin de inters utilizando el diseo empleado. Cada Una de ellas habra dado resultados en algunamedida diferentes de los arrojados por la muestra usada. La variabilidad que se observara entre todas las muestras posibles constituye el error de muestreo, el cual no se conoce pero puede ser estimado a partir de los datos suministrados por la muestra realmente seleccionada. El error de muestreo de una estimacin (promedio o porcentaje, por ejemplo) se mide por medio del error estndar, el cual se define como la raz cuadrada de la varianza de la estimacin y es una medida de su variacin en todas las muestras posibles. En consecuencia, el error estndar mide el grado de precisin con que el promedio, porcentaje, o estadstica basado en la muestra, se aproxima al resultado que se habra obtenido si se hubiera entrevistado a todas las mujeres de la poblacin bajo las mismas condiciones.

El error estndar puede ser usado para calcular intervalos ("lmites de confianza") dentro de los cuales hay una determinada "confianza" de que se encuentra el valor poblacional. As, si se toma cierta estadstica calculada de la muestra (un porcentaje, por ejemplo) y se le suma y resta dos veces su error estndar, se obtiene un intervalo al cual se le asigna una confianza de 95 por ciento de que contiene, en este caso, el porcentaje poblacional.

Para ms detalles sobre los clculos de errores de muestreo, vase el APNDICE B del informe final
