# Sampling

## Sampling Procedure

---

The IYARHS sample covered 1,815 unmarried women and 2,341 unmarried men. The respondents were identified in the 2002-2003 IDHS Household Questionnaire. The IDHS sample was drawn from a frame of census blocks (CBs) developed for the 2002 National Socioeconomic Survey (Susenas), for which a household listing had been conducted. The list includes all private households, which are defined as a person or a group of persons who usually sleep in the same housing unit and have a common arrangement for the preparation and consumption of food.

The IYARHS sample was stratified to yield reliable estimates at the national level. The remaining 26 provinces included in the Susenas are grouped in six strata: two in Sumatera and one each in Java, Nusa Tenggara, Kalimantan, and Sulawesi.

For further details on sample design and implementation, see Appendix A of the final report.

## Response Rate

---

A total of 9,099 households were selected in the sample, of which 8,730 were occupied. Of the households found in the survey, 8,633 were successfully interviewed, yielding a response rate of 99 percent.

In the interviewed households, 2,187 female and 2,929 male respondents were identified for individual interview. Of these, completed interviews were conducted with 1,815 women and 2,341 men, yielding response rates of 83 and 80 percent, respectively.

### DATA COLLECTION NOTES

#### Training

Training of the survey field staff for the survey was preceded by training of instructors. This training was designed as a workshop format, where the participants took turns in leading the discussions in each aspect of the survey. This format was preferred to the formal lecture type of training because it gives participants more opportunity to learn about the subjects covered in the survey. The training took place in August 2002.

Training for the survey field staff took place in nine locations throughout the country: Medan (North Sumatera), Pandeglang (Banten), Jakarta (DKI Jakarta), Salatiga (Central Java), Malang (East Java), Banjarmasin (South Kalimantan), Ujung Pandang (South Sulawesi), Gorontalo and Jayapura (Papua). Training lasted for ten days and followed the model Demographic and Health Surveys training guidelines.

During training, interviewers were instructed to ensure that interviews were conducted in private, as presence of other persons may bias the respondent's response.

#### Data Collection

Data for the 2002-2003 IYARHS were collected by 31 interviewing teams. Each team consisted of one supervisor, one female interviewer, and one male interviewer. The number of sample points selected in a province determined the number of teams in that province. In each province, the Province Statistics Director was responsible for the implementation of the IDHS and IYARHS in that province, while the Chief of the Population and Social Statistics Division was assigned as the Field Coordinator. During the course of data collection, Province Statistics Office staff and CBS staff visited the field periodically to monitor the progress of the fieldwork. Data collection took place over a six-month period from November 21, 2002 to April 9, 2003.

# Data Processing

## Data Editing

---

All completed questionnaires, accompanied by the control forms, were returned to the BPS central office in Jakarta for data entry and processing. The data processing consisted of office editing, coding of open-ended questions, data entry, verification, and editing computer-identified errors. Since the IYARHS was implemented in tandem with the 2002-2003 IDHS, census blocks that were selected for both surveys were processed simultaneously. A team of about 40 data entry clerks, data editors, and data entry supervisors processed the data. Census and Survey Processing System (CSPRO) software was used to process the survey data.

## Data Appraisal

### Estimates of Sampling Error

Detailed description of estimates of sampling errors are presented in Appendix B of the survey report.
