Sampling

Sampling Procedure

The EPAG impact evaluation employs a randomized pipeline research design in which recruits were randomly assigned to receive training in either Round 1 (March 2010 to February 2011) or Round 2 (July 2011 to June 2012). Impact is defined as the change in outcomes between the time the program starts and six months after the classroom training ends, as compared to a statistically similar control group (the Round 2 trainees). This control group is used to establish a "counterfactual" -a reasonable approximation of what would have happened to the Round 1 trainees had they not entered the program. 1273 girls were randomly selected to begin training in Round 1 (the treatment group).

Deviations from Sample Design

The eligibility criteria stemmed from the project's objective to reach young women at an early enough age to alter the trajectory of their working years, to focus on girls who already had the basic literacy and numeracy skills needed to succeed in the labor market, and to avoid incentivizing anyone to drop out of school. However, recruitment—particularly for younger girls who were both not in school and literate—proved challenging and the age limit was raised to 27.

Response Rate

Of the 2,106 girls recruited for the project, 2,005 girls responded to the baseline survey (a response rate of 95.2%).

Questionnaires

Overview

Two instruments were developed for the EPAG baseline survey: one for the young women who were eligible for the program, and one for the head of the household in which she resided.

DATA COLLECTION NOTES

Community mobilization campaigns began in September 2009 and trainee recruitment took place from December 2009 through January 2010 in all nine target communities.

Baseline data was collected on variables that could potentially change as a result of program participation. A variety of variables were measured in order to investigate the hypothesis that this investment in young women would improve, not only their employment and earnings, but also non-economic outcomes and the economic situation of their families. Data was also collected on time-invariant characteristics, such as ethnic group or childhood experiences, that are likely to influence a respondent's socioeconomic status regardless of program participation.

Data was collected in face-to-face interviews in each respondent's home. On average, it took 1 hour 52 minutes to administer the individual questionnaire and 1 hour 24 minutes to survey the household. Respondents were assured of the confidentiality of their responses, and that they were free to stop at any time.

A total of 44 enumerators and five supervisors conducted the survey between January 25 and April 1, 2010.

Data Processing

Data Editing

Data entry was conducted by trained clerks using CS-PRO software, and data analysis was conducted using SPSS and Stata.
