Sampling

Sampling Procedure

The Gambia Integrated Household Survey (IHS) was administered to a representative sample of households. A total of 4,800 households were interviewed. In the previous IHS 2003/2004, about one third of the surveyed households were in urban areas and two thirds in rural areas. It should be noted that the 2010 survey followed the same sampling technique as the 2003 selecting the same enumeration areas. Some of these were rural in 2003 but considered urban in 2010 based on developments in terms of population, infrastructure and social services.

The daily record form which was used for recording daily household expenditure was administered to half of the sample in 2003/04 and was not used in 2010 because of low literacy level of some of the sampled households.

The survey used a two-stage probability proportional to size design (PPS), stratified random sampling (size being number of households per EA) without replacement was adopted. In the first stage 240 Enumeration areas were selected consisting of four sub-samples of 60 EA. Each was covered during the entire survey period of twelve months. Each phase of the survey process lasted for 3 months and was allocated 60 EAs.

Questionnaires

Overview

Three types of questionnaires were used during the survey namely;

1. Household Questionnaire Part I
2. Household Consumption Expenditure Questionnaire Part II
3. Village Questionnaire Part III
