Sampling

Sampling Procedure

A total of 192 individuals were enrolled in this study. So that the study might be able to observe whether the services had different impacts based on the type of customer that was participating, different types of individuals were recruited to participate in the study, as follows:

Individuals who already had an individual savings account with NVRB: 96.

Individuals who did not have a bank account with NVRB, but who did have a bank account with another bank: 48

Individuals who did not have a bank account at any bank: 48

Within each of the three groups, half were female, and half were male.

All study participants also met the following eligibility criteria:

Live or work within a one kilometer radius of the NVRB Nkwanta branch.

Earning an income and self-employed in non-agricultural activities. (Excluded occupations included salaried and wage workers, pensioners, students, apprentices, seasonal income earners such as all kinds of farming, pastors, traditional rulers, natural resource extraction such as fishermen and hunters, road construction, afforestation, waste management, and laborers.)

I interested in receiving the services being offered, and willing to pay the collection service fee.

As part of the study, study participants were randomly assigned to the following six treatment arms:

A1: No deposit collection & No lockbox (32 individuals) - pure control group

A2: No deposit collection & Lockbox (32 individuals)

B1: Daily deposit collection & No lockbox (32 individuals)

B2: Daily deposit collection & Lockbox (32 individuals)

C1: Weekly deposit collection & No lockbox (32 individuals)

C2: Weekly deposit collection & Lockbox (32 individuals)

The randomization was stratified by type of customer, so that the different types of customer would be evenly spread across the following six arms.

DATA COLLECTION NOTES

Timeline: Individuals were enrolled in this study between August 2013 and March 2014. On the same day that an individual was enrolled in the study, he or she also completed the baseline survey.

Lockboxes were distributed in early May 2014. The deposit collection service was provided from May 5 2014 through the end of December 2014.

Endline data was collected in November 2014.

Data was collected from individuals using a household survey administered to the study participants. The survey was written and administered in English. Survey responses were recorded on paper, and were entered using double-data entry and reconciliation.
