#### ABSTRACT

O Inquérito sobre Indicadores de Malária (IIM 2018) é um inquérito de base populacional, com representatividade a nível nacional, urbano e rural concebido de acordo com as directrizes do grupo de trabalho RBM-MERG (Roll Back Malaria Monitoring and Evaluation Working Group). O objectivo principal do IIM 2018 é fornecer estimativas actualizadas de indicadores demográficos básicos e de saúde, relacionados com a malária. Especificamente, o IIM 2018 recolheu dados sobre redes mosquiteiras, tratamento intermitente e preventivo da malária em mulheres grávidas (TIP) e procura de cuidados e tratamento da febre nas crianças. As crianças de 6-59 meses de idade foram igualmente submetidas a testes de diagnóstico rápido da malária e testes de anemia. As mulheres entrevistadas foram avaliadas quanto ao seu conhecimentos sobre prevenção, diagnóstico e tratamento da malária. As informações produzidas através do IIM 2018 servirão de suporte aos decisores de políticas de saúde e gestores de programas, na avaliação e concepção de estratégias e intervenções para melhorar a saúde da população no país.

# Sampling

## Sampling Procedure

---

O desenho da amostra do IIM 2018 obedece duas fases que permitem estimativas dos principais indicadores da malária para os seguintes domínios:

- Nacional
- Áreas urbanas e rurais
- Cada uma das onze províncias nomeadamente: Niassa, Cabo Delgado, Nampula, Zambézia, Tete, Manica, Sofala, Inhambane, Gaza, Maputo Província, e Maputo Cidade.

A primeira fase da amostragem envolveu a selecção de pontos de amostra (conglomerados) do quadro de amostragem. As Áreas de Enumeração (AEs) delineadas no Recenseamento Geral da População e Habitação 2007 (RPGH 2007), actualizadas com base no Recenseamento Geral da Agricultura 2009, foram utilizadas como o quadro de amostragem. Das AEs abrangidas no Recenseamento Geral da População e Habitação 2007, foram seleccionadas um total de 224 AEs ou conglomerados, com probabilidade proporcional ao tamanho. Destas AEs, 92 estavam localizadas nas áreas urbanas e 132 em áreas rurais. Nas áreas urbanas, foram recolhidas mais amostras dentro do conglomerado, a fim de produzir estimativas robustas para cada área ou domínio.

A segunda fase da amostragem envolveu uma selecção sistemática de agregados familiares dentro de cada AE. As equipas de trabalho de campo fizeram à listagem ou enumeração de agregados familiares após chegarem na AE e, os agregados familiares incluídos no inquérito, foram aleatoriamente seleccionados com base na listagem feita aos agregados familiares. Em cada AE foram seleccionados 28 agregados familiares, totalizando um tamanho de amostra de 6.279 agregados familiares. Uma vez que o tamanho de amostra é aproximadamente semelhante em cada região, a amostra não foi auto-ponderada a nível nacional. Os resultados apresentados neste relatório foram ponderados para atender à complexidade do desenho da amostra.

Todas as mulheres com idades compreendidas entre os 15-49 anos, que residiam habitualmente nos agregados familiares seleccionados ou tinham passado a noite anterior ao inquérito no agregado familiar, foram elegíveis para o inquérito. Com o consentimento dos pais ou cuidadores, as crianças dos 6-59 meses de idade foram submetidas a teste de anemia e malária por TDR.

Para obter informação adicional sobre os procedimentos de amostragem, consulte o apêndice A.

## Response Rate

---

Entre os agregados familiares presentes, 6.196 foram entrevistados com sucesso, representando uma taxa de resposta de agregados familiares total de 99%. Nos agregados familiares entrevistados, 6.290 mulheres elegíveis foram identificadas como elegíveis para a entrevista individual e 6.184 mulheres foram entrevistadas com sucesso, dando uma taxa de resposta de 98,3%.

# Questionnaires

## Overview

---

Os dados foram recolhidos com recurso a três tipos de questionários: o questionário para agregados familiares, o questionário para mulheres e o questionário de biomarcadores. Os questionários foram adaptados dos questionários padrão do RBM-MERG, de modo a reflectir as questões demográficas e de saúde relevantes para Moçambique. As modificações foram determinadas ao longo de uma série de reuniões técnicas com vários técnicos e parceiros governamentais e não-governamentais do INS e PNCM. Os questionários traduzidos para o português foram incorporados nos tablets através do programa CSpro, permitindo aos inquiridores o uso de sistema de entrevista assistida por computador, denominado CAPI. Além disso, todas as pessoas que implementaram no campo o IIM 2018 preencheram um questionário para inquiridores, composto por duas páginas.

### Data Collection Notes

Para o trabalho de campo foram formadas vinte equipas, cada constituída por três inquiridores e um supervisor de campo. Os inquiridores fizeram o reconhecimento da área de enumeração, listagem dos agregados familiares e administração dos questionários nos agregados seleccionados. Nos agregados seleccionados, os inquiridores fizeram também a testagem de anemia e malária por TDR, trataram as crianças com malária moderada e referiram as crianças com malária grave e anemia.

Para além dos tablets para o CAPI, foram impressos questionários, manuais, formulários de consentimento informado, brochuras e fichas para uso durante os trabalhos de campo. O INS com apoio da ICF, preparou os materiais de campo, como mochilas, tendas, sacos cama, botas, camisetas, bonés e cartão de identificação dos inquiridores. Toda a logística de trabalho de campo foi coordenada pelo INS, INE e o PNCM, com apoio da ICF. Os equipamentos, materiais e outros insumos médicos para testagem de anemia e malária, foram adquiridos e enviados para as províncias pela "Global Health Supply Chain Program-Procurement and Supply Management" (GHSC-PSM) da USAID.

As actividades de recolha de dados no campo iniciaram a 26 de Março de 2018 na Cidade de Maputo. Para melhor seguimento dos inquiridores, todas as vinte equipas receberam, pelo menos, três visitas de supervisores nacionais durante todo o trabalho do campo, para além de que cada uma tinha um supervisor de campo permanente. O trabalho do campo foi concluído no dia 30 de Junho de 2018.

## Data Processing

### Data Editing

---

Os dados para o IIM 2018 foram recolhidos através de questionários programados para a aplicação CAPI. Os tablets CAPI foram programados pela ICF e adicionados os questionários para agregados familiares e mulheres. Os dados de biomarcadores foram inicialmente registados em questionários de biomarcadores em papel e, de seguida, introduzidos no CAPI no mesmo dia. Todos os dias no fim das actividades de recolha de dados, os supervisores do campo transferiam os dados para o servidor central no INS, para controlo de qualidade e verificação de erros. Para facilitar a comunicação e monitoria das actividades de recolha de dados, cada inquiridor recebeu um número único de identificação.

A ICF proporcionou assistência técnica para processamento dos dados usando o sistema CSPro (Censuses and Surveys Processing) para edição, limpeza, ponderação e tabulação de dados. No servidor central localizado no INS, os dados recebidos das aplicações CAPI das equipas no campo, foram registados e verificados para detecção de inconsistências. A edição e limpeza de dados incluiu uma extensa verificação das consistências estruturais e internas. Todas as anomalias foram comunicadas aos supervisores no campo, de modo que às equipas de processamento de dados pudessem resolver as discrepâncias entre os dados. Os resultados corrigidos foram mantidos em ficheiros de dados principais CSPro ao nível da ICF e utilizados para análise na criação de quadros para o relatório final.

## Data Appraisal

### **Estimates of Sampling Error**

As estimativas de um inquérito por amostragem podem ser afectadas por dois tipos de erro: erros relacionados com a amostra e erros não relacionados com a amostra. Os erros não relacionados com a amostra resultam de erros cometidos na implementação da recolha e processamento de dados como, por exemplo, não localizar e entrevistar o agregado familiar correcto, o entrevistador ou o inquirido entendeu mal as perguntas e erros no registo de dados. Embora tenham sido reunidos inúmeros esforços para minimizar este tipo de erro, durante a implementação do IIM 2018, os erros não relacionados com a amostragem são impossíveis de evitar e difíceis de avaliar estatisticamente.

Por outro lado, os erros de amostragem podem ser avaliados estatisticamente. A amostra de entrevistados seleccionados no IIM 2018 é apenas uma das muitas amostras que poderiam ter sido seleccionadas da mesma população, utilizando a mesma concepção e tamanho esperados. Concluindo, nos inquéritos por amostragem pretende-se analisar as características da população de dimensão  $N$ , com base numa amostra de  $n$  unidades extraídas dessa mesma população. De um modo geral, nos inquéritos por amostragem, pretende-se estimar características da população como totais, médias ou proporções.

O erro de amostragem visa avaliar a precisão das estimativas populacionais, o qual é normalmente medido através do erro-padrão, que é a raiz quadrada da variância. O erro-padrão pode ser utilizado para calcular intervalos de confiança dentro dos quais é razoável assumir que se encontre o verdadeiro valor para a população.

Samplings tabelas de erro são apresentados no Apêndice B do relatório final.
