NOTES

Notes on the Belize survey:

1. The marriage module was not included in the survey. Indicators which require information on marital status can therefore not be calculated. These indicators are: 'Contraceptive prevalence', 'Unmet need for family planning', 'Demand satisfied for family planning', 'Age at first sex among young people' and 'Age-mixing among sexual partners'.
2. In these datasets, for the variable "Ethnicity grouped" (HC1Brev), 2 households have been recoded to missing, instead of system missing. The final report which can also be found on this website was produced using an earlier set of datasets in which this correction had not been made. Therefore the tables constructed from these datasets may show some slight differences compared to those found in the published final report.

Overview

ABSTRACT

The 2006 Belize Multiple Indicator Cluster Survey has as its primary objectives:

- To provide up-to-date information for assessing the situation of children and women in Belize;
- To furnish data needed for monitoring progress toward goals established in the Millennium Declaration, the goals of A World Fit For Children (WFFC), and other internationally agreed upon goals, as a basis for future action;
- To contribute to the improvement of data and monitoring systems in Belize and to strengthen technical expertise in the design, implementation, and analysis of such systems.

KIND OF DATA

UNITS OF ANALYSIS

- Households
- Women
- Children under 5

Scope

NOTES

The 2006 Belize Multiple Indicator Cluster Survey covered the following topics:

HOUSEHOLDS

- Household Listing
- Education
- Water and Sanitation
- Household Characteristics
- Child Discipline
- Disability
- Salt Iodization

WOMEN

- Child Mortality
- Tetanus Toxoid
- Maternal and Newborn Health
- Contraception and Unmet Need
- Attitudes Toward Domestic Violence
- Sexual Behaviour
- HIV/AIDS

CHILDREN UNDER 5

- Birth Registration and Early Learning
- Child Development
- Vitamin A
- Breastfeeding
- Care of Illness
- Immunization
- Anthropometry

Sampling

Sampling Procedure

The sample for the Belize Multiple Indicator Cluster Survey (MICS) was designed to provide estimates on a large number of indicators on the situation of children and women at the national level, for urban and rural areas, and for the 6 districts: Corozal, Orange Walk, Belize, Cayo, Stann Creek and Toledo. The sample was selected in two stages: (i) the selection of 3 enumeration districts (EDs) within each of the sampling region designated as Primary Sampling Units (PSUs) and (ii) the systematic selection of 20 households within each PSU. The sample is self-weighting with each household in the sample universe being given an equal probability of being represented in the sample. A total of 2,400 households were sampled countrywide. However, there were some non-interviews which were uneven across geographical areas. For reporting national level results, sample weights were used.

Response Rate

Of the 2,400 households selected for the sample, 2,068 were found to be occupied. Of these, 1,832 were successfully interviewed for a household response rate of 88.6 percent. In the interviewed households, 1,828 women (age 15-49) were identified. Of these, 1,675 were successfully interviewed, yielding a response rate of 91.6 percent. In addition, 835 children under age five were listed in the household questionnaire. Questionnaires were completed for 796 of these children, which corresponds to a response rate of 95.3 percent. Overall response rates of 81.2 and 84.5 are calculated for the women's and under-5's interviews respectively.

Questionnaires

Overview

Three questionnaires were used in the survey: 1) a household questionnaire which was used to collect information on all de jure household members, the household, and the dwelling; 2) a women's questionnaire administered in each household to all women aged 15-49 years; and 3) an under-5 questionnaire, administered to mothers or caretakers of all children under 5 living in the household. The questionnaires included the following modules:

The Household Questionnaire included the following modules:

- o Household Listing
- o Education
- o Water and Sanitation
- o Household Characteristics
- o Child Discipline
- o Disability
- o Salt Iodization

The Questionnaire for Individual Women was administered to all women aged 15-49 years living in the households, and included the following modules:

- o Child Mortality
- o Tetanus Toxoid
- o Maternal and Newborn Health
- o Contraception and Unmet Need
- o Attitudes Toward Domestic Violence
- o Sexual Behaviour
- o HIV/AIDS

The Questionnaire for Children Under-Five was administered to mothers or caretakers of children under-5 years of age living in the households. Normally, the questionnaire was administered to mothers of under-5 children; in cases when the mother was not listed in the household roster, a primary caretaker for the child was identified and interviewed. The questionnaire included the following modules:

- o Birth Registration and Early Learning
- o Child Development
- o Vitamin A
- o Breastfeeding
- o Care of Illness
- o Immunization
- o Anthropometry

The questionnaires are based on the MICS3 model questionnaire. The MICS3 model questionnaires were adapted and pre-tested during December 2006. Based on the results of the pre-test, modifications were made to the wording of the questionnaires.

Training and Fieldwork

Training for the fieldwork was conducted for 12 days from the 23rd of January to the 3rd of February, 2006. The editors and field supervisors attended an extra day of training. Training sessions took place in four different locations: Belize City, Orange Walk, San Ignacio and Dangriga Town. In order to ensure standardization of the training a training manual was used at all training sites and all concerns or queries were reported to the Chief Statistician who after consultation responded by memo to trainers at all sites. Training included lectures on interviewing techniques and the contents of the questionnaires, practical tests, mock interviews between trainees to gain practice in asking questions and field practice of the questionnaires and anthropometry.

The data were collected by 9 work teams; each was comprised of 4 interviewers, one driver, one editor/measurer and a field supervisor. Fieldwork began February 2006 and concluded in March 2006.

Data Processing

Data Editing

Data were entered using the CPro software. The data were entered on two microcomputers and carried out by 2 data entry operators and a data entry supervisor over a five-week period. In order to ensure quality control, all questionnaires were entered twice and internal consistency checks were performed. Procedures and standard programs developed under the global MICS3 project and adapted to Belize's questionnaire were used throughout. Data processing began in March 2006 and finished in April 2006.

Other Processing

Data were analysed using the Statistical Package for Social Sciences (SPSS) software program, version 10, and the model syntax and tabulation plans developed by UNICEF for this purpose.

Data Appraisal

Estimates of Sampling Error

The sample of respondents selected in the Belize Multiple Indicator Cluster Survey is only one of the samples that could have been selected from the same population, using the same design and size. Each of these samples would yield results that differ somewhat from the results of the actual sample selected. Sampling errors are a measure of the variability between all possible samples. The extent of variability is not known exactly, but can be estimated statistically from the survey results.

The following sampling error measures are presented for each of the selected indicators:

- Standard error (se): Sampling errors are usually measured in terms of standard errors for particular indicators (means, proportions etc). Standard error is the square root of the variance. The Taylor linearization method is used for the estimation of standard errors.
- Coefficient of variation (se/r) is the ratio of the standard error to the value of the indicator - Design effect (deff) is the ratio of the actual variance of an indicator, under the sampling method used in the survey, to the variance calculated under the assumption of simple random sampling. The square root of the design effect (deft) is used to show the efficiency of the sample design. A deft value of 1.0 indicates that the sample design is as efficient as a simple random sample, while a deft value above 1.0 indicates the increase in the standard error due to the use of a more complex sample design.
- Confidence limits are calculated to show the interval within which the true value for the population can be reasonably assumed to fall. For any given statistic calculated from the survey, the value of that statistics will fall within a range of plus or minus two times the standard error ($p + 2.se$ or $p - 2.se$) of the statistic in 95 percent of all possible samples of identical size and design.

Sampling errors are calculated for indicators of primary interest, for the national total, for the regions, and for urban and rural areas. Three of the selected indicators are based on households, 8 are based on household members, 13 are based on women, and 15 are based on children under 5. All indicators presented are in the form of proportions.

Note: See detailed sampling error tables in APPENDIX C of the report which is presented in this documentation.

Other forms of Data Appraisal

Data Quality Tables

- Age distribution of household population
- Age distribution of eligible and interviewed women
- Age distribution of eligible and interviewed under-5s
- Age distribution of under-5 children
- Heaping on ages and periods
- Percentage of observations missing information for selected questions and indicators (Under-5 questionnaire, weighted), Country, Year
- Presence of mother in the household and the person interviewed for the under-5 questionnaire
- School attendance by single age
- Sex ratio at birth among children ever born and living
- Distribution of women by time since last birth

Note: See detailed tables in APPENDIX D of the report which is presented in this documentation.

Literal question

Post question

Record age in completed years.

Interviewer instructions

You will begin the interview with questions about the child's date of birth and age. These are two of the most important questions in the interview, since almost all analysis of the data depends on the child's exact age. While completed age in years is sufficient for women's interviews, we need to obtain accurate information on the child's age in months. This is necessary because some of the analysis of the information that you will be collecting can only be done on the basis of age in months. You will collect this information by learning the child's date of birth. It will then be possible to compare the date of interview with the date of birth of the child and, after the data is collected, calculate the child's age in months by comparing these two pieces of information. The questions on age and date of birth must be asked independently from similar questions on the Household Questionnaire and Questionnaire for Individual Women. The person you may be interviewing for this questionnaire may be the same woman you interviewed for the Questionnaire for Individual Women, and you may have obtained dates of birth of her children in that questionnaire. Also, you may have obtained the child's age in the Household Questionnaire. Even in such cases, you must ask these questions again. --- After having obtained the child's date of birth, ask the child's age in completed years, and record in the space provided. Remember, ages must refer to the last birthday. If the mother/primary caretaker does not know the current age of the child, try asking "HOW MANY YEARS AGO WAS (name) BORN?" You may help the respondent by relating the child's age to that of other children or to some important event or to the season of birth, by asking, for example, "HOW MANY WET SEASONS AGO WAS (name) BORN?" Ask UF10 and UF11 independently. Then, check for consistency between the date of birth and completed age. You have to be meticulous in checking for the consistency between the date of birth and age. You also have to be fairly quick in doing so. A good interviewer will perform the check without causing a lull in the conversation. Checking for consistency between date of birth (UF10) and completed age (UF11). After having obtained both date of birth and age, check for the consistency between the two. The child's age plus her year of birth must equal the year in which the child last had a birthday. Assuming that you were able to obtain a month and year of birth, you should check the consistency by following these steps: If the month of birth is before the month of interview (the child had his/her birthday this year), then her/his age plus her/his year of birth should equal the year of interview. . Example: A child who was born in October 2003, in a survey conducted in November 2005, should be age 2 ($2003 + 2 = 2005$). If the month of birth is after the month of interview (the child has not had his/her birthday this year), then her/his age plus year of birth should equal the previous year. . Example: A child who was born in December 2003, in a survey conducted in October 2005, should be age 1 ($2003 + 1 = 2004$). If the month of birth is the same as the month of interview, and the day of birth is not known, then a sum of either the current or the previous year is correct. . Example: A child born in November 2002, in a survey conducted in November 2005, could be age 3 or age 2. Probe further to see if the date of birth is correct and whether the child has completed age 2 or 3. If the month of birth is the same as the month of interview, and the day of birth is known, the sum of age and year of birth should equal the year of interview if the day of birth is before the day of interview, and the sum of age and year of birth should equal the previous year if the day of birth is after the day of interview. . Example: A child born on 8 February 2002, in an interview conducted on 15 February 2006, should be age four. A child born on 28 February 2002, in an interview conducted on 3 February 2006, should be age three, since this child will complete 4 full years on 28 February 2006. If you find that the date of birth and age are inconsistent, either the date of birth or the age, or both, are incorrect, and need to be corrected. Do not assume that one is more accurate than the other. Probe, using documents that may be available, dates of well-known events and ages of other children, of the respondent herself/himself, etc.

Vaccination card for child (im1)

File: ch

Overview

Type: Discrete
Format: numeric
Width: 1
Decimals: 0
Range: 1-9

Valid cases: 796
Invalid: 0
Minimum: 1
Maximum: 3

Pre question

If an immunization card is available, copy the dates in IM2-IM8 for each type of immunization or vitamin A dose recorded on the card. IM10-IM18 are for recording vaccinations that are not recorded on the card. IM10-IM18 will only be asked when a card is not available.

Literal question

Is there a vaccination card for (name)?

Interviewer instructions

If the respondent reports that there is a vaccination card for the child, ask to see it. You should have obtained vaccination cards at the beginning of the interview. If you did not already obtain the card for the child, now is the time to ask for it again. In some cases, the respondent may not be willing to take time to look for the vaccination card, thinking that you are in a hurry. Encourage the respondent to look for the vaccination card for the child. It is critical to obtain written documentation of the child's immunization history. Therefore, be patient if the respondent needs to search for the card. If the respondent does not have a vaccination card but the vaccine doses are registered in another document (for example, a booklet with records of clinic visits), ask to see it. If the card or other document is seen, circle '1' and continue to the next question. If the card or other document is not seen, circle '2' and skip to IM10 - you will be asking the respondent to recall the child's vaccinations. If the respondent does not have a vaccination card or any other document where the vaccine doses are registered for the child, circle '3' and skip to IM10.
