Sampling

Sampling Procedure

The sampling frame included all internet users in Beirut and surrounding areas who were able to be targeted by Facebook ads. The ad reached approximately two million such users.

Weighting

The design of the post-stratification calibration weight seeks to provide estimates that lie within the boundaries of known population values of characteristics consisting of sex, age, area of residence (zone), household size, number of rooms, and educational attainment. It relies on a two-step approach including computation of a design weight and a calibration weight.
