

ES follow-up on COVID-19: Somalia, Round 3

Implementation Report

As part of the efforts of the World Bank Group to understand the impact of COVID-19 on the private sector, the Enterprise Analysis unit is conducting follow-up surveys on recently completed Enterprise Surveys (ES) in several countries. These short surveys follow the baseline ES and are designed to provide quick information on the impact and adjustments that COVID-19 has brought about in the private sector.

The follow-up surveys re-contact all establishments [sampled in the standard ES using stratified random sampling](#). The universe of inference is all registered establishments with five or more employees that are engaged in one of the following activities defined using ISIC Rev. 3.1: manufacturing (group D), construction sector (group F), services sector (groups G and H), transport, storage, and communications sector (group I) and information technology (division 72 of group K).

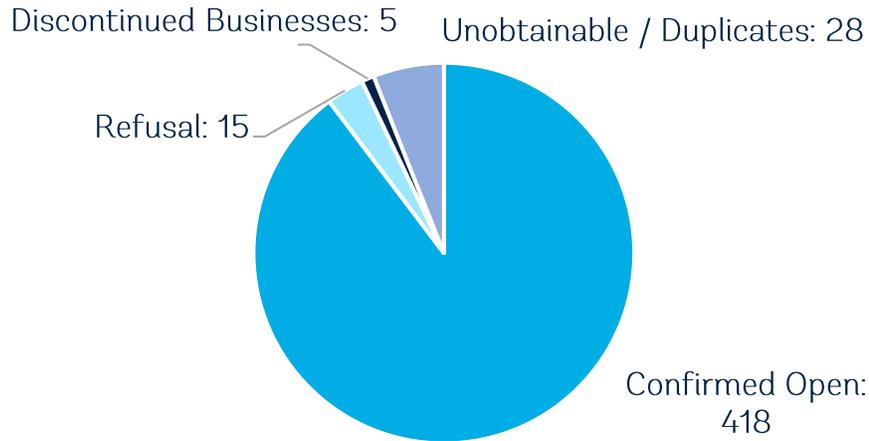

The COVID-19 survey for Somalia is slightly different from the standard follow-up survey conducted by the unit in other countries in two main ways. First, while the 2019 World Bank Enterprise Survey covered only Bosaso and Mogadishu, the COVID-19 survey has been expanded to cover additional three cities - Baidoa, Beledweyne and Kismayo. Sampling for these additional cities followed the standard ES methodology of stratified random sampling and the universe of coverage is the same as the standard ES. Second, for Bosaso and Mogadishu, establishments that refused the follow-up interview or were unobtainable are replaced by establishments that were not part of the 2019 ES, selected from the same cell (combination of size, sector, and location) as in the ES. Further, for Mogadishu the coverage of the COVID-19 survey has been expanded by increasing the sample size for the ES firms (5 or more employees) compared to the 2019 ES, and by adding micro-enterprises. The baseline ES for Bosaso and Mogadishu contains a total of 250 interviews conducted from November 2019 through February 2020. The second round of COVID-19 survey recontacts all businesses interviewed as part of round 1 survey. For these two cities, the follow-up data can be merged with the baseline data set using the variable **idstd**.

This third round of follow-up surveys was implemented as follows:

- Method of Data Collection: **Computer Assisted Telephone Interviews (CATI)**
- Data Collection Period: **August 26, 2021 – September 20, 2021**
- Reference to last completed month in data: **July/August**
- Total Sample Target: **453**
- Response Rate: **93.4 %**
- Sample Frame Source: **Completed interviews in Round 1 and 2 COVID-19 Survey**
- Average Length of Interviews: **23 minutes**
- Implementing Agency: **Altai Consulting**
- Interview Language: **English and Somali**

The dataset contains three weight variables. The baseline weights are denoted **wmedian_ES** and are used to compute the indicators that project to the baseline Universe (e.g. exit rates). To account for non-response in the follow-up, these sampling weights are adjusted by cell of stratification (combination of size, sector, and location). The resulting variable **wmedian_COVID** – recommended to be used for analysis and used to compute all other indicators – assumes that businesses that could not be re-contacted (unobtainable) have exited the market. The variable **wweak_COVID** assumes that unobtainable businesses continue to exist. Establishments that have closed permanently are interviewed using a short questionnaire which is also available in the dataset. Figure 1 reflects the outcome of attempting to re-contact the entire sample from the baseline ES.

Figure 1: Outcome of Re-contacting the Sample

The dataset contains all observations from the standard ES with the variable **eligibilitycode** indicating the outcome after attempting to reach the corresponding firm.
