LABOUR FORCE SURVEY ROUND 11: MARCH 2005

This statistical release presents a selection of key findings and tables from Stats SA's eleventh Labour Force Survey (LFS), conducted in March 2005.

1 Introduction

The LFS is a twice-yearly rotating panel household survey,¹ specifically designed to measure the dynamics of employment and unemployment in the country. It also provides insight into a variety of issues related to the labour market, including the level and pattern of unemployment and the industrial and occupational structure of the economy. The design of the questionnaire and definitions used conform to the requirements set by international bodies such as the International Labour Organisation (ILO).²

The analysis that follows focuses on various aspects of the South African labour market in March 2005. After a brief overview of the key findings, the analysis highlights industrial and sectoral employment patterns, followed by a review of the unemployment situation.

1.1 New approach

Stats SA intends to adopt a thematic approach in presenting the key findings of subsequent rounds of the LFS. This approach will be implemented fully when the historical LFS data have been revised to incorporate the changes to population estimation model used (see data revisions p. ii). It is envisaged that the themes will include: discouraged work-seekers, long-term unemployment, informal sector employment, youth in the labour market and labour force participation. However, for continuity, the data tables usually included in the preamble to the statistical release will continue to be published, even though the focus of the analysis in future will be on one specific theme. At this juncture, in the absence of comparable information from all the earlier LFS datasets, this release will not be thematic. Instead, the analysis presented here will be less detailed on specific issues than envisaged in the forthcoming thematic releases. Nevertheless, several of the issues intended for in-depth study will be briefly reviewed here.

1.2 How the LFS was conducted

Detailed information was collected about the labour market situation of approximately 69 000 adults of working age (15–65 years) living in over 30 000 households across the country. The households living in sampled dwelling units in each of the nine provinces were visited by field staff employed and trained by Stats SA, and an LFS questionnaire was completed through face-to-face interviews for each household visited.

The LFS is a panel survey and it should be noted that this survey is the second using the new panel, subsequent to the drawing of a new master sample based on Census 2001.

1.3 The questionnaire

Details about the questions included in the LFS questionnaire administered by field-staff are presented below. As indicated in Table A, the LFS questionnaire has seven sections, each of which focuses on a particular area of relevance to labour market issues and associated concerns. In total, the questionnaire contains 103 questions.

¹ Details of the sampling methodology and the rotating panel methodology are provided in the technical notes, p. xx.

² For definitions of terms see p. xxvii.

Table A: Contents of the LFS 11 questionnaire

Section	Number of questions	Details of each section
Cover page		Household information, response details, field staff information, result codes, etc.
Flap	7	Demographic information (name, age, sex, population group.)
Section 1	19	Biographical information (marital status, language, migration, education, training, literacy, etc.
Section 2	5	Activities related to work in the past seven days
Section 3	17	Unemployment and non-economic activities
Section 4	34	Main work activities in the past seven days
Section 5	3	Job creation and expanded public works programme activities in the past six months
Section 6	5	Agricultural activities, uncompensated activities in the past seven days
Section 7	13	Type of dwelling, ownership of the dwelling
All sections	103	Comprehensive coverage of all aspects of the labour market

1.4 Response details

Table B below shows response rates in each province. Nationally, while 88,7% of the expected 32 463 household interviews were successfully completed, it was not possible to complete interviews in 2,8% of the sampled dwelling units because they had become vacant. An additional 2,7% of all interviews were also not conducted because persons in the sampled dwelling units could not be contacted. But the non-contact rate in provinces such as Western Cape (6,9%) and Gauteng (5,7%) in part reflects the increasing difficulty in gaining access to the sampled dwelling units in high-walled security areas and golf estates.

Table B: Response rates by households, March 2005

Result code	Western Cape	Eastern Cape	Northern Cape	Free State	KwaZulu-Natal	North West	Gauteng	Mpumalanga	Limpopo	South Africa
Completed	81,8	88,5	86,8	88,2	93,7	89,3	85,0	87,1	94,3	88,7
Non-contact	6,9	1,8	1,1	3,3	0,9	1,5	5,7	1,7	1,1	2,7
Refusal	2,4	0,7	0,6	1,2	0,5	1,0	3,0	2,1	0,8	1,3
Partly completed	0,0	0,0	0,1	0,2	0,1	0,0	0,1	0,3	0,0	0,1
No usable information	0,0	0,0	0,0	0,0	0,0	0,0	0,0	0,0	0,0	0,0
Vacant	3,6	3,0	5,3	2,8	2,1	2,4	1,3	4,7	2,7	2,8
Listing error	1,6	0,2	0,6	0,5	0,5	0,2	1,0	0,5	0,1	0,6
Other	2,4	1,8	2,5	2,3	1,0	1,2	2,0	2,8	0,7	1,7
Unoccupied	1,2	3,8	2,7	1,3	1,0	4,0	1,0	0,7	0,1	1,7
Total (%)	100,0	100,0	100,0	100,0	100,0	100,0	100,0	100,0	100,0	100,0
*Total (number)	4 121	4 220	2 132	2 612	7 301	2 730	4 006	2 412	2 929	32 463

*Totals include households with no qualifying members.

1.5 Data revisions

Stats SA has revised its population model to produce mid-year population estimates in the light of recent mortality data released earlier this year (see Stats SA Statistical Release P0309.3, 2005). The benchmarks for the LFS discussed in this statistical release have been adjusted accordingly. Data for March 2004, September 2004 and March 2005 (LFS 9, LFS 10 and LFS 11) presented in this release are therefore comparable.

The re-benchmarking of earlier surveys using the new mortality information is currently underway and Stats SA will in due course release the historical datasets based on the revised information.

Caution should be exercised when interpreting the results of the LFS at levels of disaggregation below the national picture, since the revisions to the LFS data based on the new population estimates involved benchmarking at the national level in terms of age, sex and population group while at the provincial level, benchmarking was by population group only.

2 The labour market in March 2005

This section presents an overview of developments in the labour market based on information from the LFS. The analysis focuses on changes in key labour market variables over the period March 2004 to March 2005. The discussion of the labour absorption rate and labour force participation/activity and inactivity rates provides a useful context to the discussion on employment and unemployment that follows later in this report.

Table C shows the key labour market components over the period March 2004 to March 2005. The confidence limits for the estimates presented in Table C (and also for other key labour market variables) are provided in the technical notes (note 8, p. xxii).

The labour market variables presented are as follows:

- (a) the number of persons who are employed in the seven days prior to the survey interview,
- (b) the number of persons who are unemployed,
- (c) the number of persons who are economically active (i.e. the employed plus the unemployed),
- (d) the number of persons who are not economically active (for example, full-time students, full-time homemakers, discouraged work seekers, retired persons and the disabled who are unable to work),
- (e) the total number of persons aged 15–65 years, also referred to as the working-age population,
- (f) the unemployment rate (i.e. the percentage of economically active persons who are unemployed, official definition),
- (g) the labour force participation rate (i.e. the percentage of all persons aged 15–65 years who are economically active), and
- (h) the labour absorption rate (i.e. the percentage of all persons aged 15–65 years who are actually employed).

Table C: Key labour market indicators, March 2004 to March 2005 (official definition of unemployment)

Labour market category		Mar 2004*	Sep 2004	Mar 2005
		Thousand	Thousand	Thousand
a	Employed	11 392	11 643	11 907
b	Unemployed (official definition)	4 415	4 135	4 283
c	Total economically active = a + b	15 807	15 778	16 190
d	Not economically active	13 324	13 527	13 334
e	Total aged 15–65 years = c + d	29 131	29 305	29 524
f	Unemployment rate = $b * 100 / c$	% 27,9	% 26,2	% 26,5
g	Labour force participation rate = $c * 100 / e$	54,3	53,8	54,8
h	Labour absorption rate = $a * 100 / e$	39,1	39,7	40,3

* Revised on the basis of the new population estimates

In terms of unemployment, Stats SA provides data based on the official definition.³ One of the conditions for a person to be classified as unemployed is that s/he should be available to take up employment during the reference period. Up until the September 2003 LFS (LFS 8), Statistics South Africa used a period of one week for this criterion. The ILO guidelines allow for a reference period of one or two weeks in this regard. All unemployment figures in this publication use a two-week reference period.

³ See definitions of terms p. xxvii.

Over the period March 2004 to March 2005, Table C shows the following:

- A steady increase in the number of employed persons from 11 392 000 in March 2004, to as many as 11 907 000 in March 2005 – an increase of 251 000 employment opportunities in September 2004, followed by an additional increase of 264 000 in March 2005.
- A partial reversal in the downturn in unemployment that occurred in September 2004 when the level of unemployment declined by 280 000. Although unemployment levels had risen from 4 135 000 in September 2004 to 4 283 000 in March 2005 due to entries in the job market the increase was not sufficient to push unemployment levels back up to those witnessed in March 2004.
- An expansion in the number of economically active persons from 15 778 000 in September 2004 to 16 190 000 in March 2005.
- Stability in the unemployment rate in March 2005 (26,5%) at virtually the same level as in September 2004 (26,2%).

2.1 Summary labour market measures

Table D presents summary labour market measures (other than the unemployment rate, which is discussed in greater detail later in this report, p. xv).

Table D: Summary indicators, March 2004 to March 2005

Summary indicators	Mar 2004 (%)	Sep 2004 (%)	Mar 2005 (%)
Labour absorption rate:			
Male	47,2	47,7	48,5
Female	31,6	32,2	32,7
Average	39,1	39,7	40,3
Labour force participation/activity rate			
Male	62,0	62,0	62,5
Female	47,1	46,2	47,7
Average	54,3	53,8	54,8

Table D shows that:

- The increase in overall employment during the period March 2004 to March 2005 resulted in modest increases in both male and female absorption rates. These are reflected in the national average, which was 39,1% in March 2004, 39,7% in September 2004 and 40,3% in March 2005.
- Due to the expansion in the labour force or economically active population caused by the notable employment gains as well as the increase in unemployment, the labour force participation or activity rate was 53,8% in September 2004 and 54,8% in 2005.

Figure 1: Labour absorption rates in each age group, March 2004 to March 2005

Figure 1 illustrates a large variation in labour absorption rates by age. For the country as a whole, persons that were employed accounted for 39,1% of the working-age population in 2004, rising to 40,3% in 2005 as a result of the expansion of employment opportunities. However, fewer than 15% of persons aged 15-24 years were in employment, compared with nearly 60% of persons aged 45-54 years.

Table E: Reasons for being not economically active, March 2005

Reason	March 2005	
	Thousand	%
Scholar	4 956	37.2
Homemaker	1 050	7.9
Retired	255	1.9
Disabled/ill	1 547	11.6
Too young/old	973	7.3
Cannot find any work	3 511	26.8
Other/unspecified	1 041	7.8
Total	13 334	100

Table E shows that of the 13 334 000 persons that were not economically active, as many as 4 956 000 (37%) were scholars, an additional 1 547 000 (12%) were disabled or ill, while 1 050 000 (8%) were homemakers.

3 Employment patterns in March 2005

This section focuses on various aspects of the employment situation in the South African economy. In the first instance, employment by industry is discussed. This is followed by an analysis of the pattern of employment in terms of occupational grouping, and finally, an overview of developments in the formal and informal sector.

3.1 Employment by industry

Table F shows the industrial distribution of employment over the period March 2004 to March 2005.

- The number of employed persons rose from 11,4 million in March 2004 to 11,6 million in September 2004 and 11,9 million in March 2005. The industries that registered the largest increases in employment growth over the period September 2004 to March 2005 were agriculture (up by 107 000 jobs) and trade, up by a similar number. And notably, the mining sector posted modest gains – up by 21 000 jobs – from 405 000 in September 2004 to 426 000 in March 2005.

Table F: Employment by industry, March 2004 to March 2005

Industry	Mar 2004 Thousand	Sep 2004 Thousand	Mar 2005 Thousand
Agriculture	1 258	1 063	1 170
Mining	558	405	426
Manufacturing	1 594	1 714	1 652
Electricity	106	99	125
Construction	659	824	813
Trade	2 355	2 542	2 649
Transport	582	563	593
Finance (inc. business services)	1 070	1 147	1 141
Community services	2 158	2 185	2 235
Private households	1 025	1 075	1 075
Other	27	26	29
Total	11 392	11 643	11 907

However, some of these employment gains were offset by job losses in industries such as manufacturing (down by 63 000 jobs) and construction (down by 11 000 jobs). Figure 2 illustrates the changes that occurred in each industry.

Table F and Figure 2 indicate that:

- The severe drought in many parts of the country affected agricultural employment. Jobs in the sector declined by 16% – from 1 258 000 in March 2004 to 1 063 000 in September 2004 (a loss of 195 000 jobs). However, March 2005 saw a slight increase in the number of jobs in this industry.

Figure 2: Industrial distribution of employment, March 2004 to March 2005

Figure 3: Provincial distribution of employment, March 2004 to March 2005

Figure 3 shows that:

- The number of employed persons was virtually unchanged in Northern Cape and Mpumalanga over the period March 2004 to March 2005.
- There was relatively strong employment growth in provinces such as Eastern Cape and to a lesser extent in KwaZulu-Natal and Gauteng over the same period
- The employment situation in Free State and Western Cape stabilised in March 2005.

Figure 4: Employment in agriculture in each province as a percentage of total employment, March 2004 to March 2005

Figure 4 shows the change in employment in agriculture in each province. It can be seen that the impact of the drought on agricultural employment was widespread. In Northern Cape, Limpopo and North West, the percentage of workers employed in the sector continued to decline over time (March 2004 to March 2005). For example, in Northern Cape, the share of agriculture in total employment fell from 27% in March 2004, to 18% of total employment in March 2005. And over the same period, in Limpopo, the share of agriculture in total employment declined from 15% to 9%. However, modest employment gains in the sector occurred in provinces such as Western Cape, Free State, KwaZulu-Natal and Mpumalanga.

3.2 Employment by occupation

This section focuses on the distribution of employed persons at the three highest levels of the occupational structure (as a single group). Thus, persons employed as managers, professionals, semi-professionals and technicians have been added together and the resulting number has been expressed as a percentage of total employment in each province.

Figure 5: Occupations grouped: Managers, professionals, semi-professionals and technicians in each province as a percentage of total employment, March 2004 to March 2005

Figure 5 shows that nationally the proportion of the most senior personnel i.e. managers, professionals, semi-professionals and technicians (as a group) of total employment was 22,0% in March 2004, declining to 21,6% in September 2004 and 20,7% in March 2005. However, the national figures mask provincial variations, as follows:

- Among employed persons in Gauteng, the percentage of this group of senior personnel was 23,9% in March 2005 as against 29,4% in March 2004 and 25,0% in September 2004.
- Among employed persons in Eastern Cape, the percentage of this group (managers, professionals, semi-professionals and technicians) was 17,2% in March 2005, as against 20,2% in March 2004 and 18,7% in September 2004.

3.3 Employment in the formal and informal sector

This section discusses the overall pattern of employment in the formal and informal sectors and then highlights important provincial, gender and population group differences in the distribution of persons employed in each of these sectors.

Table G: Employment in the formal and informal sector, March 2004 to March 2005

Sector	March 2004 (Thousand)	Sep 2004 (Thousand)	March 2005 (Thousand)
Formal sector (excluding agriculture)	7 483	7 692	7 750
Agriculture	1 258	1 063	1 170
Informal sector (excluding agriculture)	1 766	1 946	2 071
Domestic service	847	881	850
Unspecified	38	61	67
Total employment	11 392	11 643	11 907

Table G shows that – excluding agriculture – there was an increase in formal sector employment from 7 692 000 in September 2004 to 7 750 000 in March 2005, and there were also employment gains in the informal sector – up from 1 946 000 in September 2004 to 2 071 000 in March 2005.

Figure 6: Non-agricultural employment in each province in the informal sector (including domestic workers), March 2004 to March 2005

There was substantial provincial variation in the level of non-agricultural employment in the informal sectors (Figure 6). For example:

- For the country as a whole, non-agricultural employment in the informal sector increased from 25,8% in March 2004 to 26,8% in September 2004 and 27,3% in March 2005.
- In most provinces (Western Cape, Northern Cape, Gauteng, Eastern Cape and Mpumalanga) the percentage of persons employed in the informal sector increased steadily over the period March 2004 to March 2005. In Free State and North West there was a decline in the percentage of informal sector employment (of total employment) between March 2004 and September 2004, followed by an increase in March 2005.
- And overall, the informal sector (including domestic workers) accounted for the lowest share of non-agricultural employment in Western Cape (18,1% in March 2005) and the highest in Mpumalanga (38,5% in March 2005).

Table H: Employment in the formal and informal sectors by industry (excluding agriculture), March 2005

Industry	Formal		Informal		Domestic		Total	
	Thousand	%	Thousand	%	Thousand	%	Thousand	%
Mining	417	5,4	8	0,4			426	4,0
Manufacturing	1 425	18,4	220	10,6			1 652	15,4
Electricity	121	1,6	4	0,2			125	1,2
Construction	514	6,6	294	14,2			813	7,6
Trade	1 691	21,8	942	45,5			2 649	24,7
Transport	453	5,8	132	6,4			593	5,5
Finance	1 061	13,7	72	3,5			1 141	10,6
Social & community services	2 045	26,4	183	8,9			2 235	20,8
Private households	11	0,1	214	10,3	850	100,0	1 075	10,0
Other/unspecified	12	0,2	1	0,1			29	0,3
Total	7 750	100,0	2 071	100,0	850	100,0	10 737	100,0

- Overall, in March 2005, 7,8 million persons were employed in the formal sector, about 2,1 million in the informal sector, and 0,9 million in domestic work (Table H).
- The largest group of persons employed in the formal sector worked in the community, social and personal services industry (26,4%), whereas in the informal sector the largest group worked in trade (45,5%).

4 Comparison of formal employment figures in the LFS, the QES and the SEE

Employment estimates from both the QES and SEE of March quarter 2005 are compared below with the estimates from the March 2005 LFS. The QES and SEE employment estimates are obtained from surveys of businesses. The recently introduced QES has extended the coverage of businesses from those covered by the SEE, which was limited to VAT-registered firms. The QES will replace the SEE from June quarter 2005.

The major difference between the QES (and SEE) on the one hand, and the LFS on the other, is that information on employment is collected from businesses and from household members respectively. A survey of registered businesses obviously yields only employment estimates for registered businesses, i.e. the QES (and SEE) can provide estimates of employment only for the formal sector. The LFS, however, being a survey of households, provides estimates of employment in both the formal and informal sectors.

This basic difference in respondents to the QES and LFS means that differences in estimates of formal sector employment between the QES and LFS are to be expected. For example:

- The determination that someone is employed in the formal sector through the LFS is based on answers provided by survey respondents, as to whether their employer is registered in any way. The possibility exists that some respondents misunderstand the questions and incorrectly identify very small businesses as registered, even though they may not be.
- The estimates of employment by industry provided from the LFS are also based on responses to interviewer questions, and are dependent on the respondents' knowledge of the industry of the business in which they are employed, whereas the estimates of employment by industry from the QES and other business-based surveys are determined by the industry classification of the responding businesses on Stats SA's business register, which is based on detailed knowledge of the main activities in which businesses are engaged.
- The QES does not cover agriculture, forestry, hunting and fishing, whereas the LFS covers these industries.

4.1 Comparison of formal employment figures in the LFS and the QES

Table I: Formal sector employment according to the LFS and the QES of March 2005

Industry	LFS Thousand	QES Thousand
Mining	414	453
Manufacturing	1 370	1 177
Electricity	121	44
Construction	474	381
Trade	1 465	1 357
Transport	416	313
Finance (inc business services)	934	1 425
Community services (excluding domestic)	1 965	1 789
Total (excluding agriculture, private households, other and unspecified)	7 159	6 938

Table I indicates that, according to the QES, there were 6 938 000 employed in the formal sector for the March quarter 2005, excluding agriculture. This figure also excludes employers not on the payroll of businesses. The comparable figure from the LFS, i.e. those determined to be employed in the formal sector, who are not employers, is 7 159 000. The difference of 221 000 in the total employed, as well as the differences in estimates for the various industrial sectors, may be ascribed to the reasons provided above.

4.2 Comparison of formal employment figures in the LFS and the SEE

For completeness, a comparison of employment figures determined through the SEE of March quarter 2005 is provided. As the SEE is to be discontinued, the comparison between the LFS and SEE cannot be provided in future LFS releases. The SEE provides lower employment figures than the QES (6,6 million) mainly due to more limited coverage of businesses, and the employment estimate is significantly lower than the estimate obtained from the LFS (7,7 million) for those in formal employment, including employers.

Table J: Formal sector employment according to the LFS and the SEE of March 2005

Industry	LFS Thousand	SEE Thousand
Mining	417	453
Manufacturing	1 425	1 222
Electricity	121	46
Construction	514	283
Trade	1 691	1 372
Transport	453	210
Finance (inc business services)	1 061	1 117
Community services (excluding domestic)	2 045	1 857
Total (excluding agriculture, private households, other and unspecified)	7 726	6 558

5 Unemployment patterns in March 2005 (official definition)

This section highlights key aspects of the pattern of unemployment over the period March 2004 to March 2005. The discussion initially focuses on the pattern of unemployment rates in the nine provinces and among the four major population groups, noting gender differences where appropriate. Given the youthfulness of the South African labour force and also the increasing international prevalence of youth unemployment, special attention is given to the unemployment rate by age group. The section concludes with an overview of discouraged work-seekers.

5.1 Provincial unemployment rates

As discussed earlier, the unemployment rate according to the official definition declined to 26,2% in September 2004 from 27,9% in March 2004. But the national figure masks differences in the nine provinces. The increase in the unemployment rate to 26,5% in March 2005 from 26,2% in September 2004 is not statistically significant.

Figure 7: Official unemployment rate in each province, March 2004 to March 2005

Figure 7 indicates that Western Cape had the lowest unemployment rate over the period March 2004 (16,8%) to March 2005 (17,6%) and over the same period, Eastern Cape had the highest (32,6%) in March 2004 while Limpopo had the highest in March 2005. Figure 7 also shows the following:

- In provinces such as Gauteng and Eastern Cape, there was a steady decline in the unemployment rate over the period March 2004 to March 2005.
- In provinces such as Northern Cape and Free State, the unemployment rate rose steadily over the period March 2004 to March 2005.
- In the other provinces (except Western Cape) the decline in the unemployment rate in September 2004 was followed by an increase in March 2005.

5.2 Official unemployment by population group

The variation in provincial unemployment discussed above reflects differences in natural resource endowments and also differences in the composition of the labour force in terms of the four major population groups.

Table K shows that the official unemployment rate among black African people is higher than among Indian/Asian, and coloured people by a large margin. For example, in March 2005, the official unemployment rate among black Africans was 31,6% as against 19,8% among coloured people, 18,0% among Indians/Asians and 5,1% among white people.

Table K: Official unemployment rate by population group, March 2004 to March 2005

Unemployment rate	Mar 2004 %	Sep 2004 %	Mar 2005 %
Black African	34,2	31,3	31,6
Coloured	18,0	21,8	19,8
Indian/Asian	16,5	13,4	18,0
White	4,9	5,4	5,1
Average	27,9	26,2	26,5

Figure 8: Official unemployment rate by sex and population group, March 2004 to March 2005

- Figure 8 shows that, irrespective of population group, female unemployment rates were higher than male unemployment rates.
- Although the unemployment rate among African men declined steadily over the period March 2004 to March 2005, it is still substantially higher than that of white men and women.
- Among the coloured population, both male and female unemployment rates increased over the period March 2004 to September 2004 but then declined again in March 2005.

Figure 9: Official unemployment rate by age, March 2004 to March 2005

Figure 9 shows a strong association between age and unemployment rates. Unemployment rates decline steadily with increasing age.

5.3 Discouraged work-seekers

This section provides a brief overview of an important component of the South African labour market, namely discouraged work-seekers. Persons regarded as such differ from those regarded as officially unemployed in one respect only, that they did not take active steps to find employment in the month prior to the survey interview.

Figure 10: Components of the labour market, March 2005

For example, in terms of Figure 10, the total working-age population in March 2005 (all persons aged 15–65 years) was 29 524 000. These are grouped as follows:

- Employed persons totaled 11 907 000.
- Not economically active persons, excluding discouraged work seekers, amounted to 9 510 000.
- Of persons that were unemployed and available to begin employment, only 4 283 000 had taken specific steps (applied for jobs that were advertised, etc.) to find employment (i.e. fit the official definition of unemployment).
- An additional 3 824 000 persons were unemployed and available to begin employment within two weeks of the interview but had not taken any active steps to find employment. These persons are regarded as discouraged work-seekers.

Figure 11: Discouraged work-seekers in each province as a percentage of the working-age population, March 2004 to March 2005

Figure 11 illustrates that the percentage of the working-age population that fell into the discouraged work-seeker category varied considerably in each province. In March 2005, the percentage of the working-age population in Limpopo that were discouraged work-seekers (21,9%) was more than three times greater than in Western Cape (6,3%).

Figure 12: Sex differences among discouraged work-seekers, March 2004 to March 2005

Figure 12 shows that discouraged work-seekers are predominantly female. For example, in March 2005 there were 1 414 000 male discouraged work-seekers as against 2 406 000 that were female. Overall, the total number of such persons increased from 3 765 000 in March 2004 to 3 820 000 in March 2005.

PJ Lehohla
Statistician-General: Statistics South Africa

Technical notes

1. Official and expanded unemployment rates

Statistics South Africa (Stats SA) uses the following definition of unemployment as its *official* definition. The *unemployed* are those people within the *economically active population* who: (a) did not work during the seven days prior to the interview, (b) want to work and are available to start work within two weeks⁴ of the interview, and (c) have taken active steps to look for work or to start some form of self-employment in the four weeks prior to the interview. The *expanded definition of unemployment* excludes criterion (c).

The expanded definition therefore includes persons who said they were unemployed but had not taken active steps to find work in the four weeks prior to the interview (i.e. discouraged work-seekers).

2. Sample design

Enumeration Areas (EAs) that had a household count of less than twenty-five were omitted from the census frame that was used to draw the sample of PSUs for the Master Sample. Other omissions from the Master Sample frame included all institution EAs except workers' hostels, convents and monasteries. EAs in the census database that were found to have less than sixty dwelling units during listing were pooled.

The Master Sample is a multi-stage stratified sample. The overall sample size of PSUs was 3000. The explicit strata were the 53 district councils. The 3000 PSUs were allocated to these using the power allocation method. The PSUs were then sampled using probability proportional to size principles. The measure of size used was the number of households in a PSU as calculated in the census.

The sampled PSUs were listed with the dwelling unit as the listing unit. From these listings systematic samples of dwelling units per PSU were drawn. These samples of dwelling units form clusters. The size of the clusters differs depending on the specific survey requirements. The LFS uses one of the clusters that contains ten dwelling units.

3. Rotating panel methodology

Statistics South Africa uses a rotating panel methodology for the labour force survey, to ultimately obtain a better picture of movements into and out of the labour market over time. The rotating panel methodology involves visiting the same dwelling units on a number of occasions (in this instance, five at most). After the panel is established, a proportion of the dwelling units is replaced each round (in this instance, 20%). New dwelling units are added to the sample to replace those that are taken out. The advantage of this type of design is that it provides the basis for monitoring changes in the work situation of members of the same households over time, while retaining the larger picture of the overall employment situation in the country. It also allows for both longitudinal and cross-sectional analysis.

4. Coverage

The target population is all households, as well as residents in workers' hostels and convents/monasteries. The survey does not cover institutions such as old age homes, hospitals, prisons and military barracks.

⁴ This reference period increased from one week to two weeks from mid-2004 (see also p. iii).

5. Weighting the LFS of March 2005

A two-stage weighting procedure was applied to the LFS

The PSU inclusion probability is given by

$$P_{PSU} = \frac{n_{PSU}}{N_{PSU}} \cdot n_s,$$

where n_{PSU} is the number of households constituting the selected PSU during census fieldwork, n_s is the number of PSUs per stratum, in this case the District Council (DC) and N_{PSU} is the number of households constituting the selected stratum during census fieldwork.

The household inclusion probability per PSU is given by

$$P_{HH} = \frac{n_{HH}}{H_{HH}},$$

where n_{HH} is the number of selected dwelling units per PSU, H_{HH} is the number of dwelling units in the PSU in question at a particular time different from the census time.

The non-response adjustment factor is given by $\frac{1}{r_{HH}}$, where r_{HH} is the response rate and is given by

$r_{HH} = \frac{n_{RESP}}{n_T}$ where n_{RESP} is the number of responding households and n_T is the total number of visited

households (in the sampled dwelling units) per PSU. The design weights adjusted for non-response are now given by

$$W_{HH} = \frac{1}{P_{PSU} \cdot P_{HH} \cdot r_{HH}}$$

A SAS macro called CALMAR was used to benchmark W_{HH} to the population estimates. The mid-year population estimates were adjusted to give population estimates for March 2005 (when survey fieldwork took place).

6. Symbols used in the tables that follow

When a dash (-) is shown there were no respondents in the category.

When a single asterisk (*) is shown in the table, the sample size was too small to give reliable estimates.

7. Estimation and use of standard error

The published results of the labour force survey are based on representative probability samples drawn from the South African population, as discussed in the section on sample design. Consequently, all estimates are subject to sampling variability. This means that the sample estimates may differ from the figures that would have been produced if the entire South African population had been included in the survey. The measure usually used to indicate the probable difference between a sample estimate and the corresponding population figure is the *standard error (SE)*, which measures the extent to which an estimate might have varied by chance because only a sample of the population was included.

There are two major factors which influence the value of a standard error. The first factor is the sample size. Generally speaking, the larger the sample size, the more precise the estimate and the smaller the standard error. Consequently, in a national household survey such as the LFS, one expects more precise estimates at the national level than at the provincial level due to the larger sample size involved. The second factor is the variability among households in terms of the specific characteristics of the population being estimated, for example, the number of unemployed persons in the household.

8. Confidence intervals

Stats SA has calculated 95% confidence limits for key variables. These are shown in the tables that follow.

Table A1: LFS labour market measurements, official definition of unemployment: September 2004 and March 2005 (within 95% confidence limits)

			Lower limit (‘000)	Esti- mate (‘000)	Upper limit (‘000)	Precision of difference (‘000)	Actual difference (‘000)
a	Total employed	Sep 2004	11 348	11 643	11 938	425	264

Definitions of terms

A *household* is defined as a person, or group of persons, who occupy a common dwelling unit (or part of it) for at least four days in a week on average during the four weeks prior to the survey interview. Basically, they live together and share resources as a unit. Other explanatory phrases can be “eating from the same pot” and “cook and eat together”.

A *dwelling unit* is any structure or part of a structure or group of structures occupied by one or more than one household; or which is vacant or under construction but could be lived in at the time of the survey. The dwelling unit is the major listing unit for this survey. However, if multiple households are identified during listing, then each household is listed separately. But the listing unit is not primarily households, as multiple households are sometimes discovered at the time of the survey. In workers hostels, (1) where rooms are occupied by individual persons/households, then each room is treated as a dwelling unit, and (2) in the case of dormitories/communal rooms, each bed is listed separately and treated as a dwelling unit. It is important to note that the dwelling unit as defined here was also the selection unit for this sample.

Population group describes the racial classification of a particular group of South African citizens. The previous government used legislation to impose this type of classification, to divide the South African population into distinct groupings on which to base apartheid policies. For quite a different reason it remains important for Stats SA to continue to use this classification wherever possible. It clearly indicates the effects of discrimination of the past, and permits monitoring of policies to alleviate discrimination. Note that, in the past, population group was based on a legal definition, but it is now based on self-perception and self-classification. A *black African* person is someone who classifies him/herself as such. The same applies to a *coloured*, *Indian/Asian* or *white* person.

Workers’ hostel is a communal living quarter for workers, provided by a public organisation such as a local authority, or a private organisation such as a mining company. These were residential dormitories established for migrant workers during the apartheid era, and they continue to house people working in certain industries, such as the mining industry.

The *working-age population* comprises all persons aged 15–65 years.

The *economically active population* consists of both those who are employed and those who are unemployed.

The *employed* are those who performed work for pay, profit or family gain in the seven days prior to the survey interview for at least one hour, or who were absent from work during these seven days, but did have some form of work to which to return.

The *unemployed* are those people within the *economically active population* who: (a) did not work during the seven days prior to the interview, (b) want to work and are available to start work within two weeks of the interview, and (c) have taken active steps to look for work or to start some form of self-employment in the four weeks prior to the interview. This is referred to as the *official definition of unemployment*.

People who are *out of the labour market* or who are *not economically active* are those who are not available for work. This category includes full-time scholars and students, full-time homemakers, those who are retired, and those who are unable or unwilling to work.

The *formal sector* includes all businesses that are registered in any way. For LFS this is defined by the respondents.

The *informal sector* consists of those businesses that are not registered in any way. They are generally small in nature, and are seldom run from business premises. Instead, they are run from homes, street pavements or other informal arrangements.

Workers include the self-employed, employers and employees.

Labour market dynamics refers to movement into, out of, and within the labour market over a specified time period.
