Sampling

Sampling Procedure

A sample of 30 000 households was drawn in 3 000 enumerator areas (EA's) (that is 10 households per Enumerator Area). A two stage sampling procedure was applied and the sample was stratified, clustered and selected to meet the requirement of probability sampling. The sample was based on the 1991 Population Census enumerator areas. The sampled population excluded all prisoners in prisons, patients in hospitals, people residing in boarding houses and hotels (whether temporary or semi-permanent).

The sample was explicitly stratified by province, Magisterial District, Urban/rural and Population group. The allocated number of EA's was systematically selected with probability proportional to size in each stratum. The measure of size was the estimated number of people. In each EA, a systematic sample of 10 households was drawn.

Weighting

The 1991 population Census was used as a basis for the weighting for the OHS 1995. Household weights were calculated by using the reciprocal of the inclusion probabilities. Since the sample selection was done in two stages (i.e. first stage - selection of an EA,

second stage - selection of a household in the selected EA): The inclusion probability of an EA (say p_1):

Since this was done with probability proportional to size (size being the number of persons residing in the EA),

$$p_1 = \frac{m_i}{S_i}$$

where

m_i - number of EAs in the sample in the i -th stratum (where stratum is the District Council in a province)

S_i - number of persons residing in the selected EA

S_i - total number of persons in the population in the i -th stratum

The inclusion probability of the household (say p_2):

Since ten (10) households (per EA) were selected systematically,

$$p_2 = \frac{1}{10}$$

number of households in the selected EA

Household weight = $(1/p_1.p_2)$. Relative scaling was done on this weight. The 1996 Census figures (adjusted for growth) were used as benchmarks..

To calculate the person weight, the data was post-stratified by province, race, gender and age group (5 year age groups).

The 1996 Census figures (adjusted for growth) were used as benchmarks.
