## METHODOLOGY

### Introduction

The QLFS sample covers the non-institutional population except for workers' hostels. However, persons living in private dwelling units within institutions are also enumerated. For example, within a school compound, one would enumerate the schoolmaster's house and teachers' accommodation because these are private dwellings. Students living in a dormitory on the school compound would, however, be excluded.

### Survey requirements and design

The Labour Force Survey frame has been developed as a general-purpose household survey frame that can be used by all other household surveys irrespective of the sample size requirement of the survey. The sample size for the QLFS is roughly 30 000 dwellings.

The sample is based on information collected during the 2001 Population Census conducted by Stats SA. In preparation for Census 2001, the country was divided into 80 787 enumeration areas (EAs). Some of these EAs are small in terms of the number of households that were enumerated in them at the time of Census 2001. Stats SA's household-based surveys use a Master Sample of Primary Sampling units (PSUs) which comprises EAs that are drawn from across the country. For the purposes of the Master Sample, the EAs that contained fewer than 25 households were excluded from the sampling frame, and those that contained between 25 and 99 households were combined with other EAs of the same geographic type to form Primary Sampling Units (PSUs). The number of EAs per PSU ranges between one and four. On the other hand, very large EAs represent two or more PSUs.

The sample is designed to be representative at provincial level and within provinces at the metro/non-metro level. Within the metros, the sample is further distributed by geography type. The four geography types are: urban formal, urban informal, farms, and tribal. This implies that, for example, within a metropolitan area the sample is designed to be representative at the different geography types that may exist within that metro.

The current sample size is 3 080 PSUs. It is equally divided into four subgroups or panels called rotation groups. The rotation groups are designed in such a way that each of these groups has the same distribution pattern as that which is observed in the whole sample. They are numbered from one to four and these numbers also correspond to the quarters of the year in which the sample will be rotated for the particular group.

The sample for the redesigned Labour Force Survey is based on a stratified two-stage design with probability proportional to size (PPS) sampling of primary sampling units (PSUs) in the first stage, and sampling of dwelling units (DUs) with systematic sampling in the second stage.

### Sample rotation

The sampled PSUs have been assigned to 4 rotation groups, and dwellings selected from the PSUs assigned to rotation group '1' are rotated in the first quarter. Similarly, the dwellings selected from the PSUs assigned to rotation group '2' are rotated in the second quarter, and so on. Thus, each sampled dwelling will remain in the sample for four consecutive quarters. It should be noted that the sampling unit is the dwelling, and the unit of observation is the household. Therefore, if a household moves out of a dwelling after being in the sample for, say 2 quarters, and a new household moves in, then the new household will be enumerated for the next two quarters. If no household moves into the sampled dwelling, the dwelling will be classified as vacant (unoccupied).

At the end of each quarter, a quarter of the sampled dwellings rotate out of the sample and are replaced by new dwellings from the same PSU or the next PSU on the list. A total of 3 080 PSUs were selected for the redesigned LFS, and 770 have been assigned to each of the four rotation groups.

## Weighting

The sampling weights for the data collected from the sampled households are constructed so that the responses could be properly expanded to represent the entire civilian population of South Africa. The weights are the result of calculations involving several factors, including original selection probabilities, adjustment for non-response, and benchmarking to known population estimates from the Demographic division of Stats SA.

The base weight is defined as the product of the provincial Inverse Sampling Rate (ISR) and the three adjustment factors, namely adjustment factor for informal PSUs, adjustment factor for subsampling of growth PSUs, and an adjustment factor to account for small EAs excluded from the sampling frame (i.e. EAs with fewer than 25 households).

## Non-response adjustment

In general, imputation is used for item non-response (i.e. blanks within the questionnaire), and edit failure (i.e. invalid or inconsistent responses). The eligible households in the sampled dwellings can be divided into two response categories: respondents and non-respondents, and weight adjustment is applied to account for the non-respondent households (e.g. refusal, no contact, etc.). The sampled dwellings with no eligible households, e.g. foreigners only, or no households, (i.e. vacant dwellings), do not contribute to the survey.

The non-response adjusted weight is the product of the base weight with the non-response adjustment factor given above. If the PSU level non-response rate is too high, the non-response adjustment is applied at the VARUNIT level, where two VARUNITs have been created by grouping PSUs within strata. PSU level non-response adjustment is applied only if the corresponding adjustment factor is less than 1,5.

## Final survey weights

The final survey weights are constructed using regression estimation to calibrate to the known population counts at the national level population estimates (which are supplied by the Demography division) cross-classified by 5-year age groups, gender and race, and provincial population estimates by broad age groups are used for calibration weighting. The 5-year age groups are: 0–4, 5–9, 10–14,..... 55–59, 60–64, and 65 and over. The provincial level age groups are: 0–14, 15–34, 35–64, and 65 years and over. The final weights are constructed in such a manner that all persons within a household would have the same weight.

## Estimation

The final survey weights are used to obtain the estimates for various domains of interest, e.g. number of persons employed in agriculture in the province of Western Cape, number of females employed in manufacturing, etc. The estimates of ratios are obtained as ratios of the estimated totals. Thus, survey estimates for any estimation domain can be computed using the set of final weights for the respondents in the domain of interest.

## Reliability of the survey estimates

Because estimates are based on sample data, they differ from figures that would have been obtained from complete enumeration of the population using the same instrument. Results are subject to both sampling and non-sampling errors. Non-sampling errors include biases from inaccurate reporting, processing, and tabulation, etc., as well as errors from non-response and incomplete reporting. These types of errors cannot be measured readily. However, to the extent possible, non-sampling errors can be minimised through the procedures used for data collection, editing, quality control, and non-response adjustment. The variances of the survey estimates are used to measure sampling errors. The variance estimation methodology is discussed in the next section.

## Variance estimation

The most commonly used methods for estimating variances of survey estimates from complex surveys, such as the QLFS, are the Taylor Series Linearization, Jackknife Replication, Balanced Repeated Replication (BRR), and Bootstrap methods (Wolter, 2007)<sup>1</sup>. We implemented the replication method for the QLFS mainly because of simplicity<sup>2</sup>. The QLFS sampled 3 080 PSUs by selecting an even number of 4 or more PSUs from within strata. The Jackknife method would be applicable for the sample design with more than two PSUs per stratum, but this would result in 3 080 replicates, which would be computationally very intensive. The Fay's BRR method on the other hand is applicable when two primary sampling units (PSUs) are sampled from each stratum. Therefore we decided to use Fay's BRR method by collapsing PSUs into two groups of PSUs within each stratum.

## Other measures of precision

In practice, the sampling variance itself is hardly ever reported. Instead, users find it more useful to rely on one of the derivatives of the sampling variance, such as the standard error, the coefficient of variation, the margin of error, or the confidence interval. These are all related expressions, and it is quite easy to go from one to the other using simple mathematical operations.

## Standard error

The standard error of an estimator is the square root of its sampling variance. This measure is easier to interpret since it provides an indication of sampling error using the same scale as the estimate, whereas the variance is based on squared differences. If  $\hat{\theta}$  is the estimate of a given population parameter  $\theta$  (e.g. true employment but unknown) and  $v(\hat{\theta})$  is the corresponding estimate of its variance, then the standard error of the estimate is defined as

$$se(\hat{\theta}) = \sqrt{v(\hat{\theta})}.$$

## Coefficient of variation

It is more useful in many situations to assess the size of the standard error relative to the magnitude of the characteristic being measured. The coefficient of variation<sup>(cv)</sup> provides such a measure. It is the ratio of the standard error of the survey estimate to the value of the estimate itself expressed as a percentage. It is very useful in comparing the precision of several different survey estimates, where their sizes or scale differ from one another.

## Confidence intervals

The 95% confidence interval is such that there is a 95% probability (chance of 19 out of 20) of the unknown population parameter  $\theta$  being within the interval. The 95% confidence interval is given by

$\hat{\theta} \pm 1.96 \times se(\hat{\theta})$ . The lower limit of the interval is  $\hat{\theta} - 1.96 \times se(\hat{\theta})$ , and the upper limit of the interval is  $\hat{\theta} + 1.96 \times se(\hat{\theta})$ . The width  $1.96 \times se(\hat{\theta})$  is known as half-width of the 95% confidence interval. The smaller the half-width of the confidence interval, the more precise is the survey estimate.

## Design effects

Most surveys are based on complex designs involving stratification and clustering due to multi-stage designs. Moreover, the weighting involves non-linear adjustments (e.g. non-response and weight calibration adjustments, etc.). It is crucial that these features of the complex survey design be accounted for in the variance estimation (Choudhry and Valliant, 2003). The design effect compares the variance of the estimate from the sample design that was actually implemented to the variance of the estimate that would have been obtained from a simple random sample (SRS) design. Design effect is another way to evaluate

<sup>1</sup> Wolter KM, 2007. *Introduction to Variance Estimation*, 2<sup>nd</sup> Edition. New York: Springer-Verlag

<sup>2</sup> Note that variance estimation methodology was not implemented for the LFS

the efficiency of a sample design and the procedure used to develop the survey estimates. Design effect is defined as the ratio of the variance of an estimate for a complex sample design and the variance of the estimate under the SRS design with the same sample size. Kish (1965)<sup>3</sup> introduced the concept of design effect to deal with complex sample designs involving stratification and clustering. Stratification generally leads to a gain in efficiency over simple random sampling, but clustering leads to deterioration in the efficiency of the sample design due to positive intra-cluster correlation among units in the cluster (PSUs in the case of QLFS). To determine the total effect of any complex design on the sampling variance in comparison to the alternative simple random sample design, the design effect (*deff*) is defined as:

$$Deff = \frac{\text{sampling variance of a complex sample design}}{\text{sampling variance of simple random sample design}}$$

A design effect can be derived for any sampling design and estimator, provided we can compute a sampling variance. It is important to note that the design effect is associated with both the design and the estimator. Therefore, for a given survey, the design effect can vary substantially from one variable to another.

### Effective sample size

Another concept that is often used is effective sample size defined as the actual sample size that was selected for the complex design divided by the corresponding design effect. The effective sample size can be interpreted as the sample size that would be needed for an SRS design to obtain the same variance as that obtained with the complex design (i.e. the design that was actually implemented).

## CONTENTS OF CD

The CD contains a flat, ASCII, fixed-field file, with one line of given length per record. This format was chosen so as to make the data usable with as many statistical programs as possible, and thus accessible to as wide a range of people as possible.

Users can also access, explore and download the micro data in various formats, i.e. SAS, SPSS, Stata, etc., as well as the metadata from StatsOnline at [www.statssa.gov.za](http://www.statssa.gov.za). Click on 'Interactive data' then 'Explore micro data'.

### Other important information can be found in the:

Questionnaire  
Additional code lists (occupation and industry)  
Relevant statistical release  
Record layouts  
Stats SA website: [www.statssa.gov.za](http://www.statssa.gov.za)

### The data file

The data file contains information on sections 1, 2, 3 and 4.

Each section contains the following information for each variable:

#### Description of variables

**Descriptive name:** This is a short description of the variable with the variable name in brackets.

**Position of the variable:** The position of a variable within a record is recorded in the format (@xxx y). '@xxx' indicates that the variable starts at position (i.e. column) xxx, and 'y' indicates the length of the field.

**Final code list:** The range of valid values for variables. For continuous variables it only reflects the upper and lower limits.

**Not applicable:** The code for 'missing' values is given for each variable (□ = Not applicable).

**Note to users:** Additional information for further clarity on questions.

## DATA FILE

*Unique number (UQNO)* (@ 1 18.)

Unique household identifier allocated to each household.

## SECTION 1

**This section covers particulars of each person in the household.**

### Question 1.2

*Stayed at least four nights (Q12NIGHTS)*

(@22 1.)

<b>1.2</b>	<p><b>Has.....stayed in this household for at least four nights on average per week during the last four weeks?</b></p> <p>1 = YES</p> <p>2 = NO → <i>End of questions for this person</i></p>	<input type="checkbox"/> 1 <input type="checkbox"/> 2
------------	--	--

#### Note to users

This question was asked for each person found in the selected dwelling. Those who were not household members (those who had not spent at least four nights per week during the last four weeks) were excluded from the data (2 = No). The instruction in this question was to end the interview for those who had answered 'No' to this question. It is by means of this question that household members are identified within the selected dwelling.

#### Universe

Every person who had stayed in the households in selected dwelling units at least four nights a week in the four weeks prior to the interview.

#### Final code list

1 = Yes

### Question 1.3

*Gender (Q13GENDER)*

(@23 1.)

<b>1.3</b>	<p><b>Is..... a male or a female?</b></p> <p>1 = MALE</p> <p>2 = FEMALE</p>	<input type="checkbox"/> 1 <input type="checkbox"/> 2
------------	---	--

#### Note to users

This question was asked for all household members, to determine their gender. Enumerators were instructed not to assume the gender of household members by just looking at people's names or physical appearances. In this instance, they had to ask the respondent the gender of each member of the household without any assumptions.

#### Universe

Every person who had stayed in the households in selected dwelling units at least four nights a week in the four weeks prior to the interview.

#### Final code list

1 = Male  
 2 = Female

**Question 1.4***Age (Q14AGE)*

(@24 3.)

1.4	What is.....'s date of birth and age in completed years?	Day of birth: Example of day	<input type="text"/>	<input type="text"/>
		Month of birth: Example of month	<input type="text"/>	<input type="text"/>
		Year of birth: Example of year	<input type="text"/>	<input type="text"/>
		Age (less than 1 year = 000)		

**Derived variable**

This is a derived variable indicating the age of the household member. Age of the household member was derived from question 1.4 of the questionnaire.

This question was asked for each member of the household. The instruction was to write the age in completed years to the nearest whole numbers and not in words. Thus, if a person was two years and six months, the instruction was to write the two completed years. For children aged less than a year, the instruction was to write 000.

**Universe**

Every person who had stayed in the households in selected dwelling units at least four nights a week in the four weeks prior to the interview.

**Final code list**

Valid range: 0–107

**Question 1.5***Population group (Q15POPULATION)*

(@27 1.)

1.5	What population group does..... belong to?	1 = AFRICAN/BLACK	<input type="text"/>
		2 = COLOURED	<input type="text"/>
		3 = INDIAN/ASIAN	<input type="text"/>
		4 = WHITE	<input type="text"/>
		5 = OTHER, specify, in the box at the bottom	<input type="text"/>

**Note to users**

This question was asked to determine the population group of persons from the selected dwelling units. The respondent had to answer for each member and the enumerator was not to make any assumptions. The enumerator was also instructed not to come to any conclusions, which may be influenced by his observation or using people's names during the interview. This question may seem very sensitive to some respondents especially in this post apartheid era, but it is important to find out the composition of the South African population.

**Universe**

Every person who had stayed in the households in selected dwelling units at least four nights a week in the four weeks prior to the interview.

### Final code list

- 1 = African/Black
- 2 = Coloured
- 3 = Indian/Asian
- 4 = White

### Question 1.6

*Marital status (Q16MARITALSTATUS)*

(@28 1.)

<b>1.6</b>	<b>What is .....’s present marital status?</b>	
	1 = MARRIED	<input type="text"/> 1
	2 = LIVING TOGETHER LIKE HUSBAND AND WIFE	<input type="text"/> 2
	3 = WIDOW/WIDOWER	<input type="text"/> 3
	4 = DIVORCED or SEPARATED	<input type="text"/> 4
	5 = NEVER MARRIED	<input type="text"/> 5

### Note to users

This question is about the marital status of the members of the household. Both modern and traditional marriages are considered in this question.

### Universe

Every person who had stayed in the households in selected dwelling units at least four nights a week in the four weeks prior to the interview.

### Final code list

- 1 = Married
- 2 = Living together like husband and wife
- 3 = Widow/Widower
- 4 = Divorced or separated
- 5 = Never married

**Question 1.7***Highest education level (Q17EDUCATION)*

	19 = CERTIFICATE WITH GRADE 12/STD 10	<input type="checkbox"/> 19
	20 = DIPLOMA WITH GRADE 12/STD 10	<input type="checkbox"/> 20
	21 = BACHELORS DEGREE	<input type="checkbox"/> 21
	22 = BACHELORS DEGREE AND DIPLOMA	<input type="checkbox"/> 22
	23 = HONOURS DEGREE	<input type="checkbox"/> 23
	24 = HIGHER DEGREE (MASTERS, DOCTORATE)	<input type="checkbox"/> 24
	25 = OTHER, <i>specify in the box at the bottom</i>	<input type="checkbox"/> 25
	26 = DON'T KNOW	<input type="checkbox"/> 26
		<input type="text"/>

**Note to users**

Enumerators were instructed that it was only those qualifications already obtained which had to be entered. That means the current level of study with which a person was still busy, was not applicable. It was very important to complete each record even if the person had not attended school. Enumerators were instructed to record diplomas and certificates that were of at least six months' duration.

**Universe**

Every person who had stayed in the households in selected dwelling units at least four nights a week in the four weeks prior to the interview.

**Final code list**

00 = No schooling  
 01 = Grade R/0  
 02 = Grade 1/Sub A  
 03 = Grade 2/Sub B  
 04 = Grade 3/Standard 1  
 05 = Grade 4/Standard 2  
 06 = Grade 5/Standard 3  
 07 = Grade 6/Standard 4  
 08 = Grade 7/Standard 5  
 09 = Grade 8/Standard 6/Form 1

 19 = Certificate with Grade 12/Std 10  
 20 = Diploma with Grade 12/Std 10  
 21 = Bachelors Degree  
 22 = Bachelors Degree and Diploma  
 23 = Honours Degree  
 24 = Higher Degree (Masters, Doctorate)  
 25 = Other  
 26 = Do not know

**SECTION 2**

**This section covers economic activities in the last week for persons aged 15 years and older.**

**Question 2.0**

*Person himself/herself responding (Q20SELFRESPOND)*

*(@31 1.)*

<b>2.0</b>	<p><i>Interviewer to answer</i></p> <p><b>Is the person him/herself responding to questions?</b></p> <p>1 = YES → <b>Go to Q 2.2</b></p> <p>2 = No</p>	<input type="text"/> 1 <input type="text"/> 2
------------	--	--

**Note to users**

This question was answered by the enumerator. It was recommended that if all the members of the household who qualified for this section were present, they should answer for themselves. It is by means of this question that the accuracy of the information received can be qualified, as it would reflect whether people answered for themselves or a proxy responded on their behalf.

**Universe**

All members of the households in selected dwelling units aged 15 years and older.

**Final code list**

1 = Yes

2 = No

9 = Unspecified

**Note:** Questions 2.1–2.3 are not included in the data, as these questions were asked for administrative purposes and as such do not have any impact on the analysis of the data.

**Question 2.4**

2.4	In the last week....	YES	No
	<b>(a) Did you work for a wage, salary, commission or any payment in kind (including paid domestic work), even if it was for only one hour?</b>  <i>Examples: a regular job, contract, casual or piece work for pay, work in exchange for food or housing, paid domestic work.</i>	<input type="checkbox"/> 1	<input type="checkbox"/> 2
	<b>(b) Did you run or do any kind of business, big or small, for yourself or with one or more partners, even if it was for only one hour?</b>  <i>Examples: Commercial farming, selling things, making things for sale, construction, repairing things, guarding cars, brewing beer, collecting wood or water for sale, hairdressing, crèche businesses, taxi or other transport business, having a legal or medical practice, performing in public, having a public phone shop, etc.</i>	<input type="checkbox"/> 1	<input type="checkbox"/> 2
	<b>(c) Did you help without being paid in any kind of business run by your household, even if it was for only one hour?</b>  <i>Examples: Commercial farming, help to sell things, make things for sale or exchange, doing the accounts, cleaning up for the business, etc.</i>	<input type="checkbox"/> 1	<input type="checkbox"/> 2
	<b>If yes to any part of Q 2.4 go to Section 4, otherwise go to Q 2.5</b>		

**Note to users**

This question is applicable to all household members aged 15 years and older, regarding their involvement in economic activities in the seven days prior to the interview. This is part of the questionnaire where there would be a differentiation between the economically active population and those who are not economically active. The instruction to enumerators was that they should consider those activities that lasted for at least an hour within the last seven days. In order to be certain that the categories had been answered, there should either be a 'Yes' or 'No' answer to all of them. Most importantly, if there was a 'Yes' to any part of this question, there should be a skip to Section 4. If all the categories were 'No', there should be a continuation to the next question.

*Paid work (Q24APDWRK)*

(@32 1.)

a. Do any work for a wage, salary, commission or any payment in kind (excluding domestic work)?

**Universe**

All members of the households in selected dwelling units aged 15 years and older who in the last week did any work for a wage, salary, commission or any payment in kind.

**Final code list**

1 = Yes

2 = No

☐ = Not applicable

*Own business (Q24BOWNBUSNS)*

(@33 1.)

b. Run or do any kind of business, big or small, for himself/herself or with one or more partners?

**Universe**

All members of the households in selected dwelling units aged 15 years and older who in the last week ran or did any kind of business, big or small, for himself/herself or with one or more partners.

**Final code list**

1 = Yes

2 = No

☐ = Not applicable

*Unpaid work (Q24CUNPDWRK)*

(@34 1.)

c. Help unpaid in a household business of any kind?

**Universe**

All members of the households in selected dwelling units aged 15 years and older who in the last week helped unpaid in a household business of any kind.

**Final code list**

1 = Yes

2 = No

☐ = Not applicable

**Question 2.5**

## Note to users

This question was applicable to all household members aged 15 years and older, regarding their involvement in economic activities in the last seven days prior to the interview. This is part of the questionnaire where there would be a differentiation between the economically active population and those who are not economically active. The instruction to enumerators was that they should consider those activities that lasted for at least an hour within the seven days. In order to be certain that the categories had been answered, there should either be a 'Yes' or 'No' answer to all of them. If 'Yes' to any of these questions, the number of hours spent on the activity had to be indicated as well.

CODE BOXES FOR OFFICE USE																

**Note to users**

This question was applicable to household members who had worked before, but were currently unemployed. It is important that the main tasks should be in English as the occupational codes are in that language only. The instruction to the enumerator was to ask the respondent the main tasks or duties done in his/her last job given in Question 3.15.a. Questions 3.15.a and 3.15.b were write-in questions. The responses were used to determine the person's last occupation. The occupation was coded to four digits on the basis of the South African Standard Classification of Occupations (SASCO) (see occupation code list).

<p>CODE BOXES FOR OFFICE USE</p>	

## Note to users

This question was applicable to household members who had been employed previously, but were currently unemployed or economically inactive. It is important that the service or main goods produced at the respondent's previous work are in English as the industry codes are in this language only. Although a person may have had certain roles and responsibilities within the company she/he was working for, the enumerator was instructed to record the main goods or services produced by the company. Questions 3.16.a and 3.16.b were write-in questions. The responses were used to determine the type of industry. The industry was coded to three digits on the basis of the Standard Industrial Classification of all Economic Activities (SIC) (see industry code list).
