Sampling

Sampling Procedure

El diseo de la muestra para la Encuesta sobre Salud Familiar fue de probabilidad de rea con tres etapas de seleccin. Se hizo un muestreo independiente de tres estratos, o dominios: el municipio de Managua, otras reas urbanas y reas rurales. El Departamento de Zelaya, en la Costa Atlntica, fue excluido de la muestra, por razones logsticas y de costo.

La primera etapa de seleccin para las otras reas urbanas y rurales consisti en tomar al azar una muestra sistemtica para seleccionar los sectores censales en el dominio, con probabilidad de seleccin proporcional al nmero de viviendas existentes en cada sector, basado en un conteo de las viviendas que se realiz en 1982 como parte de la preparacin de un censo que nunca se realiz.

Para las reas urbanas haba 75 sectores censales seleccionados y 75 sectores censales seleccionados para las reas rurales. La primera etapa de seleccin para Managua, fue tambin un muestreo sistemtico. Para Managua, se decidi dirigir la Encuesta sobre Salud Familiar dentro los sectores censales que coincidieran con las Juntas Receptoras de Votantes (JRVs) seleccionadas para la Encuesta de Medicina de Nivel de Vida (EMNV), dirigido por el Instituto Nacional de Estadsticas y Censos (INEC). Para la EMNV se seleccionaron las JRVs con probabilidades de seleccin proporcional al nmero de votantes registrados en los JRVs, basados en las listas de registros de votantes preparadas para las elecciones realizadas en 1990. De los 167 sectores censales que coinciden con las JRVs seleccionadas para la EMNV en el municipio de Managua, se seleccion la mitad, o sea 84 sectores censales para incluir en la muestra de la Encuesta sobre Salud Familiar.

Antes de hacer la segunda etapa de seleccin, la cartografa para los 234 sectores censales seleccionados en la primera etapa fue actualizada tal que los mapas de los sectores tendran una enumeracin correcta de las viviendas en cada sector. La segunda etapa de la seleccin consisti en escoger 40 viviendas dentro de cada sector censal en una forma aleatoria con el fin de asegurar que todas las viviendas en cada sector tuvieran igual probabilidad de ser seleccionados. De esta forma, la muestra consiste de 3,360 viviendas en Managua, 3,000 en otras reas urbanas y 3,000 viviendas en reas rurales. Dado que hay una probabilidad desigual de seleccin de una vivienda dentro de cada estrato, se utiliza un factor de ponderacin que es proporcional al inverso de la probabilidad de seleccin en cada estrato, para realizar clculos que combinan las observaciones de los diferentes estratos. Los factores de ponderacin utilizados son: 1.0 para Managua; 1.39 para otras reas urbanas; y 2.07 para reas rurales. Los factores de ponderacin estn basados en estimaciones del tamao de la poblacin de Nicaragua en cada de los tres estratos, segn los datos de la Encuesta Socio-Demogrfica Nicaragense, ESDENIC 85 (INEC, 1989).

La tercera etapa de seleccin consisti de escoger en una forma aleatoria solamente una mujer de edad frtil (MEF), de 15-49 aos de edad, por cada vivienda. Por lo tanto, la probabilidad de seleccin de cada entrevistada era inversamente proporcional al nmero de MEF en la vivienda. As, se aplicaron factores de ponderacin para compensar esta probabilidad desigual de seleccin. Este factor es el nmero de MEF en la vivienda. Para las mujeres que tenan hijos en el periodo a partir de agosto de 1987, se escogi aleatoriamente un hijo para administrar preguntas sobre temas de salud de los nios. Para los anlisis de salud de los nios menores de 5 aos se aplicaron factores de ponderacin para compensar la probabilidad desigual de seleccin de los nios.

Este factor de ponderacin es el nmero de nios que cada mujer tuvo a partir de agosto de 1987. En los cuadros que se presentan en este informe, las proporciones y los promedios se basan en los nmeros de casos ponderados, pero tambin se muestran los nmeros de casos no ponderados u observaciones.

Response Rate

Se realizaron entrevistas completas en 94.4 por ciento de las viviendas que tenan una mujer elegible, para hacer un total de 7,150 entrevistas completas. La tasa de entrevistas completas no vari de manera apreciable por rea de residencia.

DATA COLLECTION NOTES

Se formaron 6 equipos de trabajo de campo, los cuales eran formados por 5 encuestadoras, un conductor y una supervisora por cada equipo. Laboraron dos supervisores regionales, los cuales tenían a su cargo 3 equipos cada uno. En resumen el personal de trabajo de campo estaba constituido por 30 encuestadoras, 6 supervisoras y 2 supervisores regionales. A medida que los equipos de trabajo de campo recolectaban los datos, estos se digitaban paralelamente logrando así poder efectuar chequeos de consistencia de cuestionario para correcciones inmediatas si las hubiese. Esto permitió llevar un control de calidad estricto y constante, a través de todo el trabajo de campo. Debido a ausencias de las mujeres en edad fértil a entrevistar, se programaron revisitas en el trabajo de campo. Se llegaron a realizar hasta 5 revisitas en una vivienda. También se programaron revisitas para corregir errores de consistencia encontrados en la hora de digitación.

El periodo de entrenamiento y selección de personal que laborara en el trabajo de campo comenzó en la tercera semana de octubre de 1992, y finalizó dos semanas después. El trabajo de campo comenzó el 3 de noviembre en la ciudad de Managua y concluyó el 13 de febrero de 1993.

De las 9,360 viviendas seleccionadas para la muestra, se visitaron 9,200, no pudiéndose visitar 160 viviendas ubicadas en cuatro sectores rurales (tres de Jinotega y uno de Boaco) debido a problemas de seguridad en el área al momento de realizar el trabajo de campo. En general, el 3.5 por ciento de las viviendas se encontraron desocupadas y solamente en 1.2 por ciento de las viviendas hubo rechazo a la entrevista.

Ochenta y un por ciento de las viviendas de la muestra, incluían por lo menos una mujer entre las edades de 15-49 años.
